

# CSS Modules in Google+

+Shubhie Panicker  
shubhie@gmail

# Problems of Large Apps

Lots of features => Lots of JS & CSS

CSS size: ~ 870K uncompressed / ~ 175k compressed

# Problems of ~~Large~~ Apps

Writing maintainable CSS

# CSS Problems in Google+

- Initial bundle is too big and too slow
- Manually curated CSS is prone to reordering
  - Broken UI
  - Specificity wars

# What's this talk about?

- Module System
  - Reduce CSS size
  - Cut down initial load time
- Dependency System
  - Needed for shared code
  - Vastly improved CSS development
    - Deterministic & correct cascade order
    - Never fight specificity
- Status

# Identify shared code

- Start with the obvious: repeating UI elements
- Lot of repeating patterns in Google+

### The Music Before they Burned the Church

Here's a photo from the Burning Man photowalk - thanks again everyone for coming out! It was so fun!! :) I'm looking forward to seeing all the photos as people begin to upload them.

This inventive church has hymn sheets that fly out of the organ. When people sit down to play, all the sheets light up in different colors and flow out of the church through the windows and the roof. It is a really amazing piece of art. It's called the "Church Trap" because right behind me is a big stick that is holding up one end of the church... Last night they burned the whole thing down while we sat around the outside to watch... #BurningMan

Pulitzer Prize-winning author Hedrick Smith says America has lost the title of "the land of opportunity." He claims that the way we have responded with our New Economy has put the middle class in an ever-tightening financial squeeze.

Is he right? If so, how do we reclaim the American Dream? (via Next Avenue)

**Martin Lewitt** 5:23 PM

I wonder why PBS chose to push Hedrick Smith's book?

**D. Lamar Sobotor** 6:09 PM

Who is he and why should anyone care?

**Eric Anderson** 6:28 PM · +7

Regardless of who he is, the US has less socioeconomic upward mobility than most other developed economies. So

# Shared Styles

In addition, even more shared styles:

- across Google+: fonts, colors
- across Google: buttons, checkboxes ..

# Competing goals

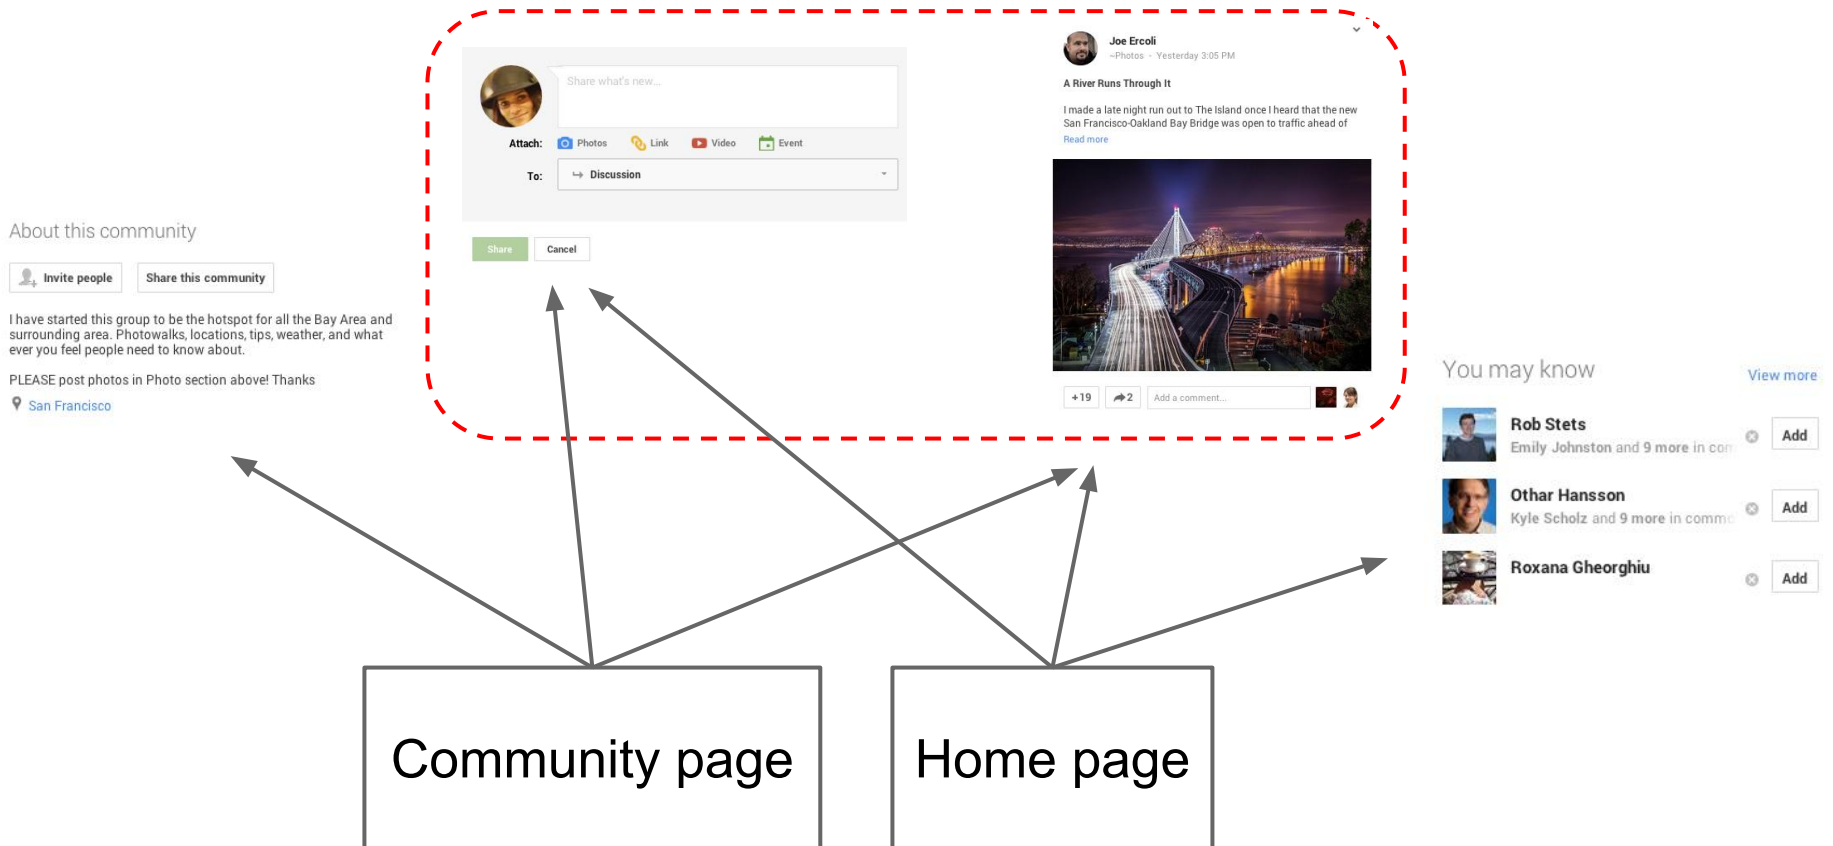

Features developed by different teams

- Split code by project boundary - BUT ALSO
- Share common styles

Need a dependency system.

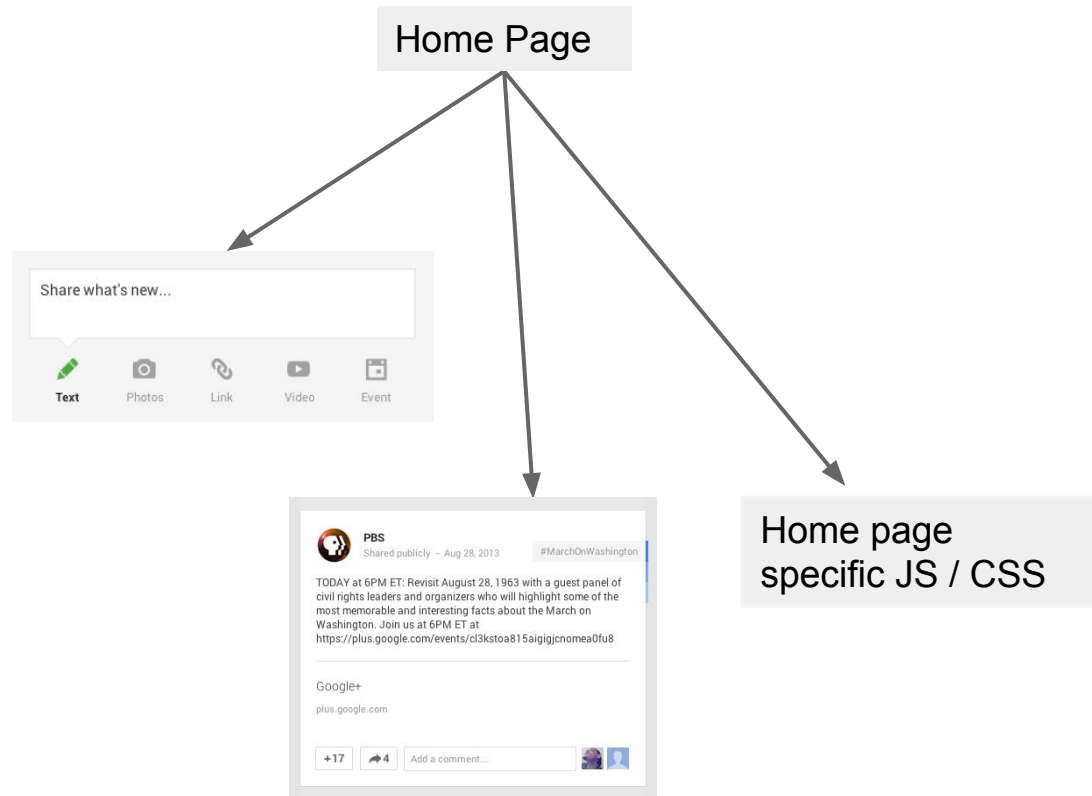

# Shared Code

- Write once
- Download once
- Download the minimum needed

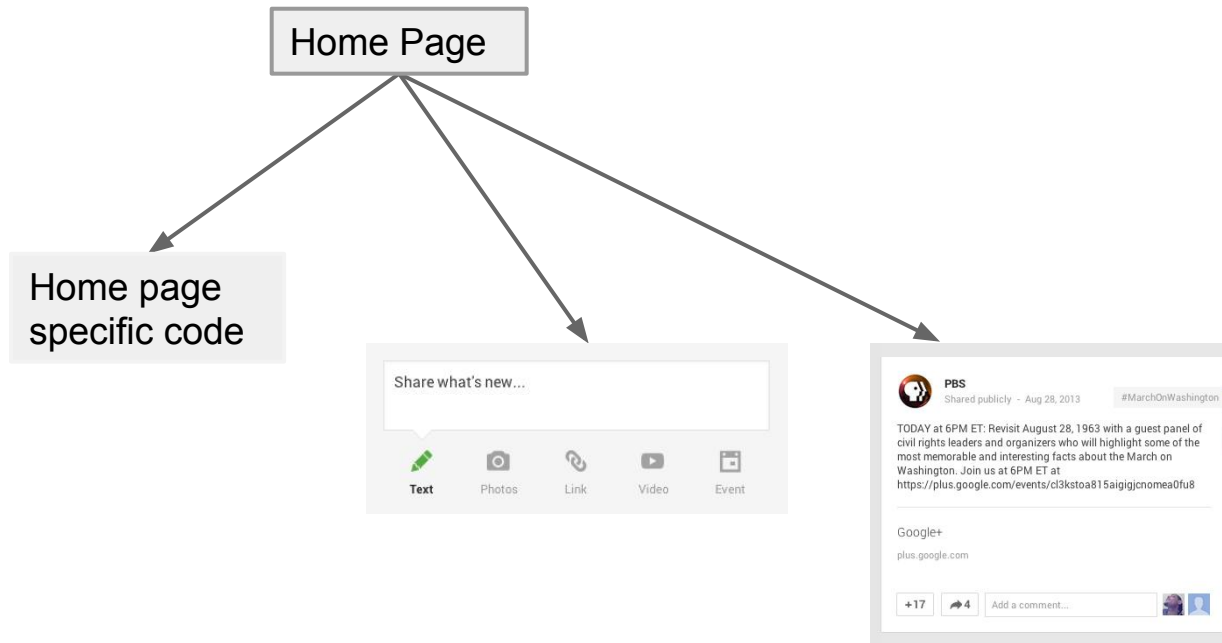

# Consider ALL the code needed

code = Template + JS + CSS

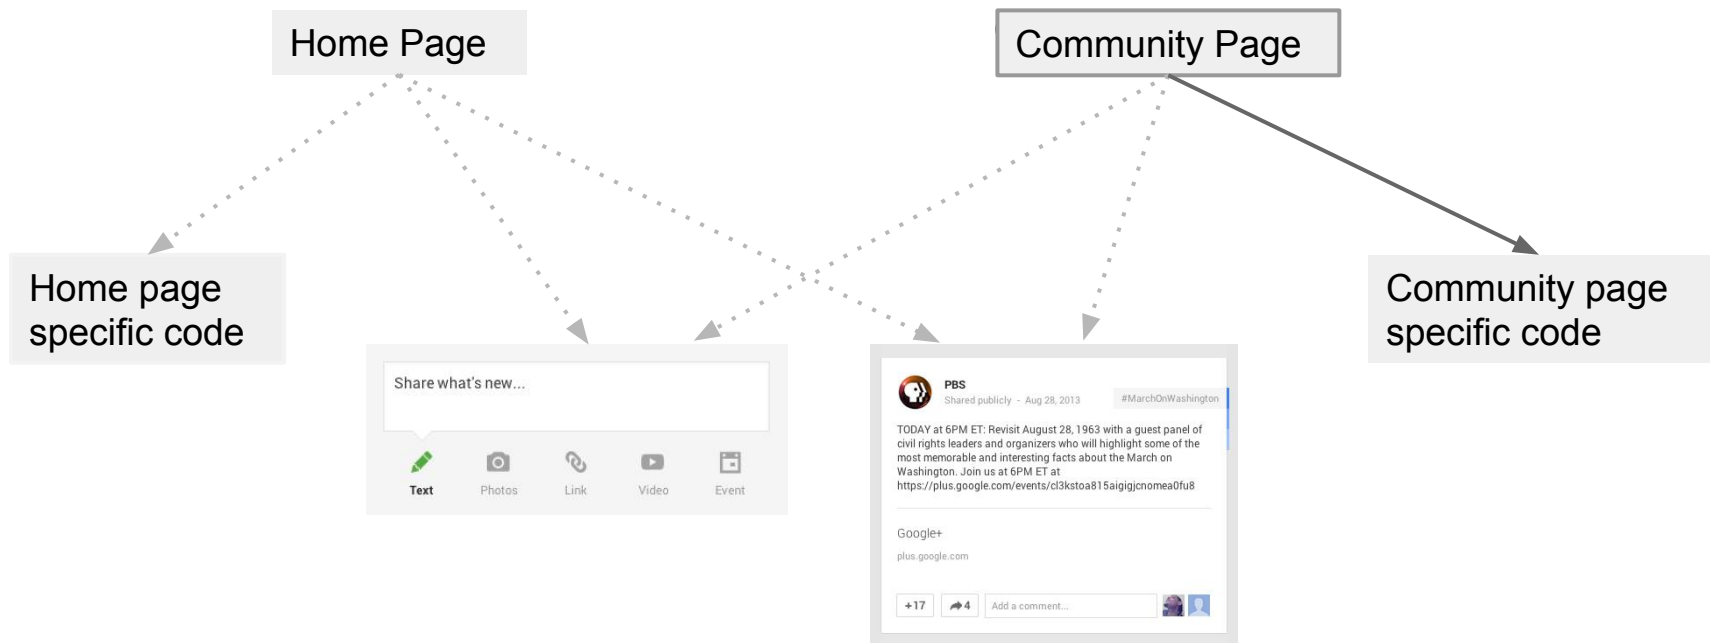

# GOAL: Make initial page load fast

# GOAL: Just download what we need when we need it.

Incrementally add code for features as they are surfaced by user.

# Building on solution for JS

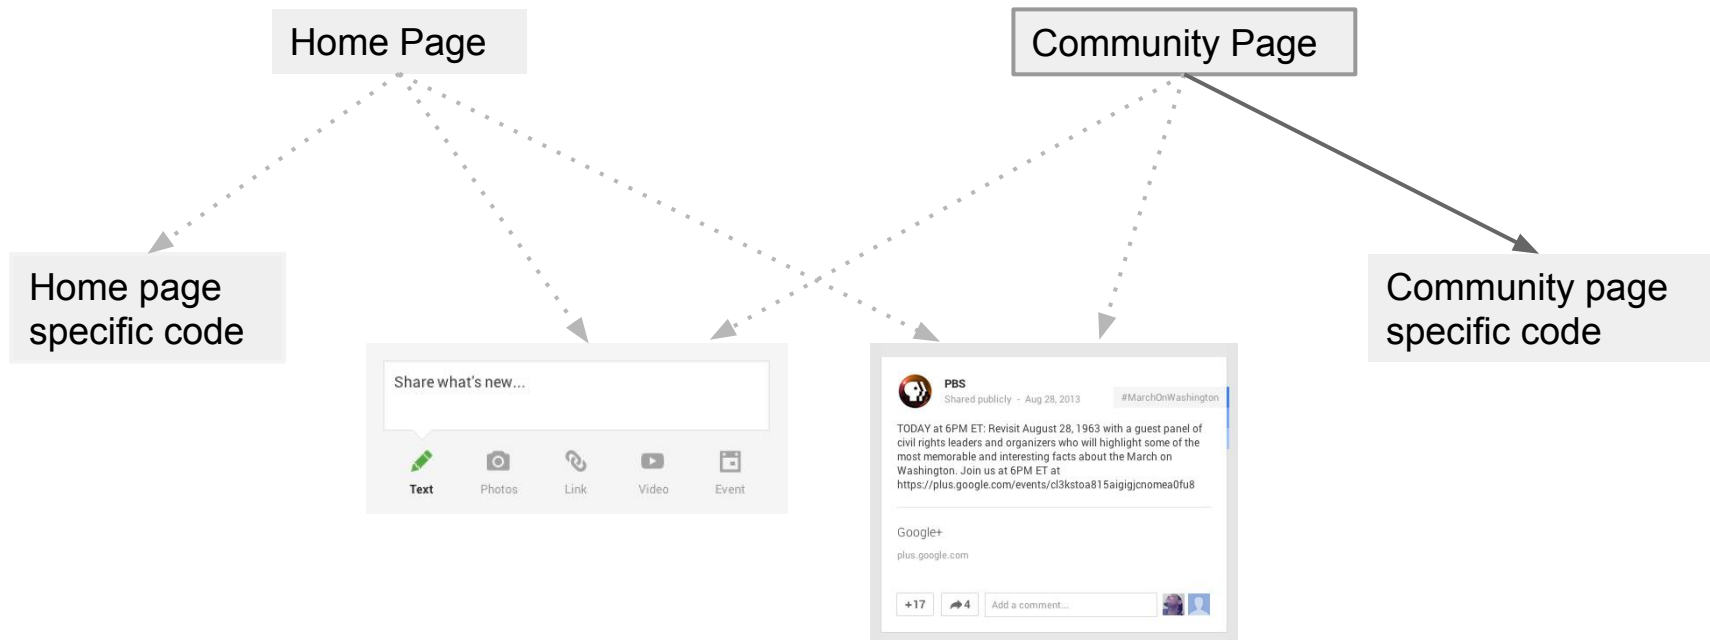

## JS Modules

- Incremental download solved.
- Examples
  - AMD, CommonJS
  - Open source Google moduleserver
- No solution for CSS.
  - Can we use the same solution?

# GOAL: Safe incremental download.

Late module must not override base styles from earlier module.

No UI regressions on previous pages.

# CSS is not so simple.

## Challenges:

- Safety: CSS load order can alter styles for previously loaded pages
- Need dependency system but no notion of deps!
  - **require** in CommonJs; **import** in java, python
  - How to include only what is used?

Cannot simply piggyback on JS modules.

- **GOAL:** Deliver minimum CSS.  
Incrementally. And Safely.
- Challenges
  - Bundle CSS with dependencies
  - Download CSS as needed
  - Safely compose CSS in the browser

# Need a Module System

## 1. Dependency System

- Bundle CSS with dependencies

## 2. Assembly & Serving system

- Download as needed
- Safely compose in browser

# **Challenge #1**

Bundling CSS

# Modules & Dependencies

## CSS Module

- Bundle of CSS - supports a page of our site
- Downloaded together

## Types of CSS dependencies

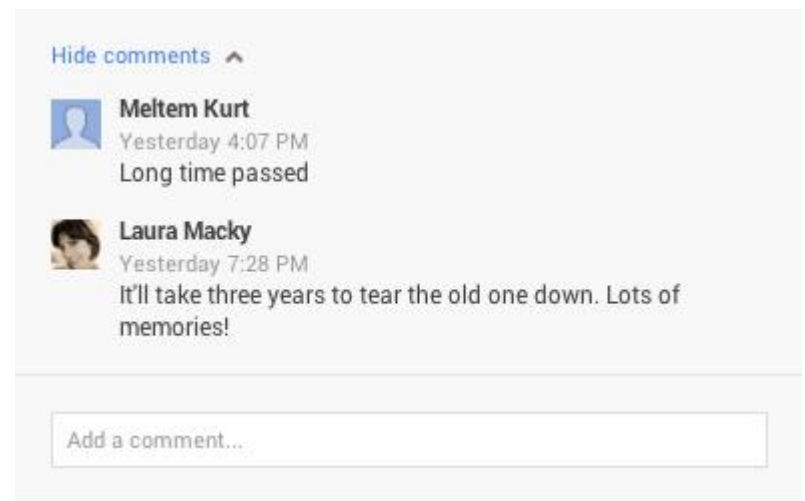

1. CSS from shared components
2. Fonts, colors etc. -- constants & mixins
3. Common CSS libraries

# Naive solutions don't work

- Don't duplicate
  - Can't just use multiple CSS @import
- Only include what you need
  - Eg. only want 1 of n variants of a component
- No single “shared deps” module for entire site!

# I. CSS for shared components

Which CSS belongs to which of these?

# Peg CSS to 'components'

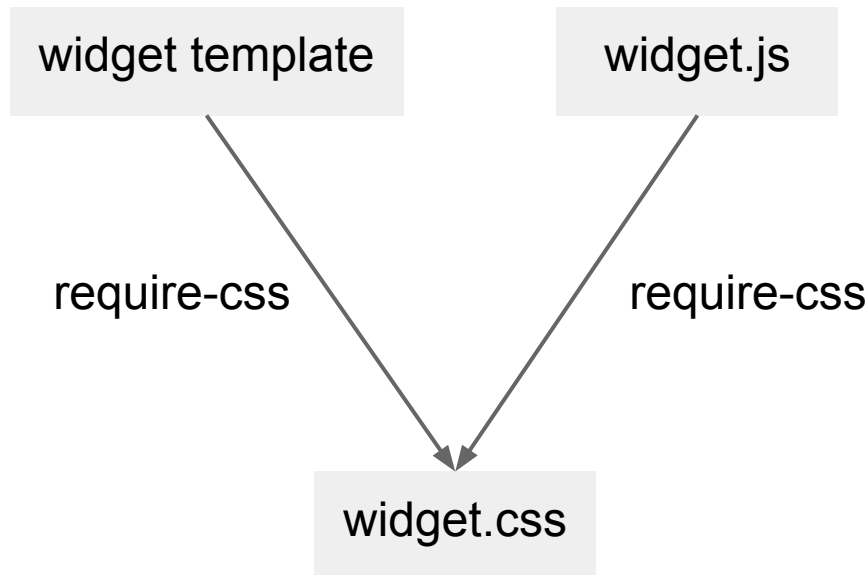

- Identify shared components
  - CSS comes with the component
- Bundle component code together
  - Component = Template + JS + CSS

# Similar to CSS *legos*

- Existing idea: reusable groups of CSS
- New idea: self contained components
  - Include Template + JS + CSS
  - Let the framework do the work
  - ... not just disciplined programming

# How to create self contained components?

- Dependency from Template to CSS
- Dependency from JS to CSS

# Dependency from Templates

- Closure templates
- “requirecss” to declare dep to CSS

```
{template .navMenuButton requirecss="common.menubutton"}
```

# Dependency from Javascript

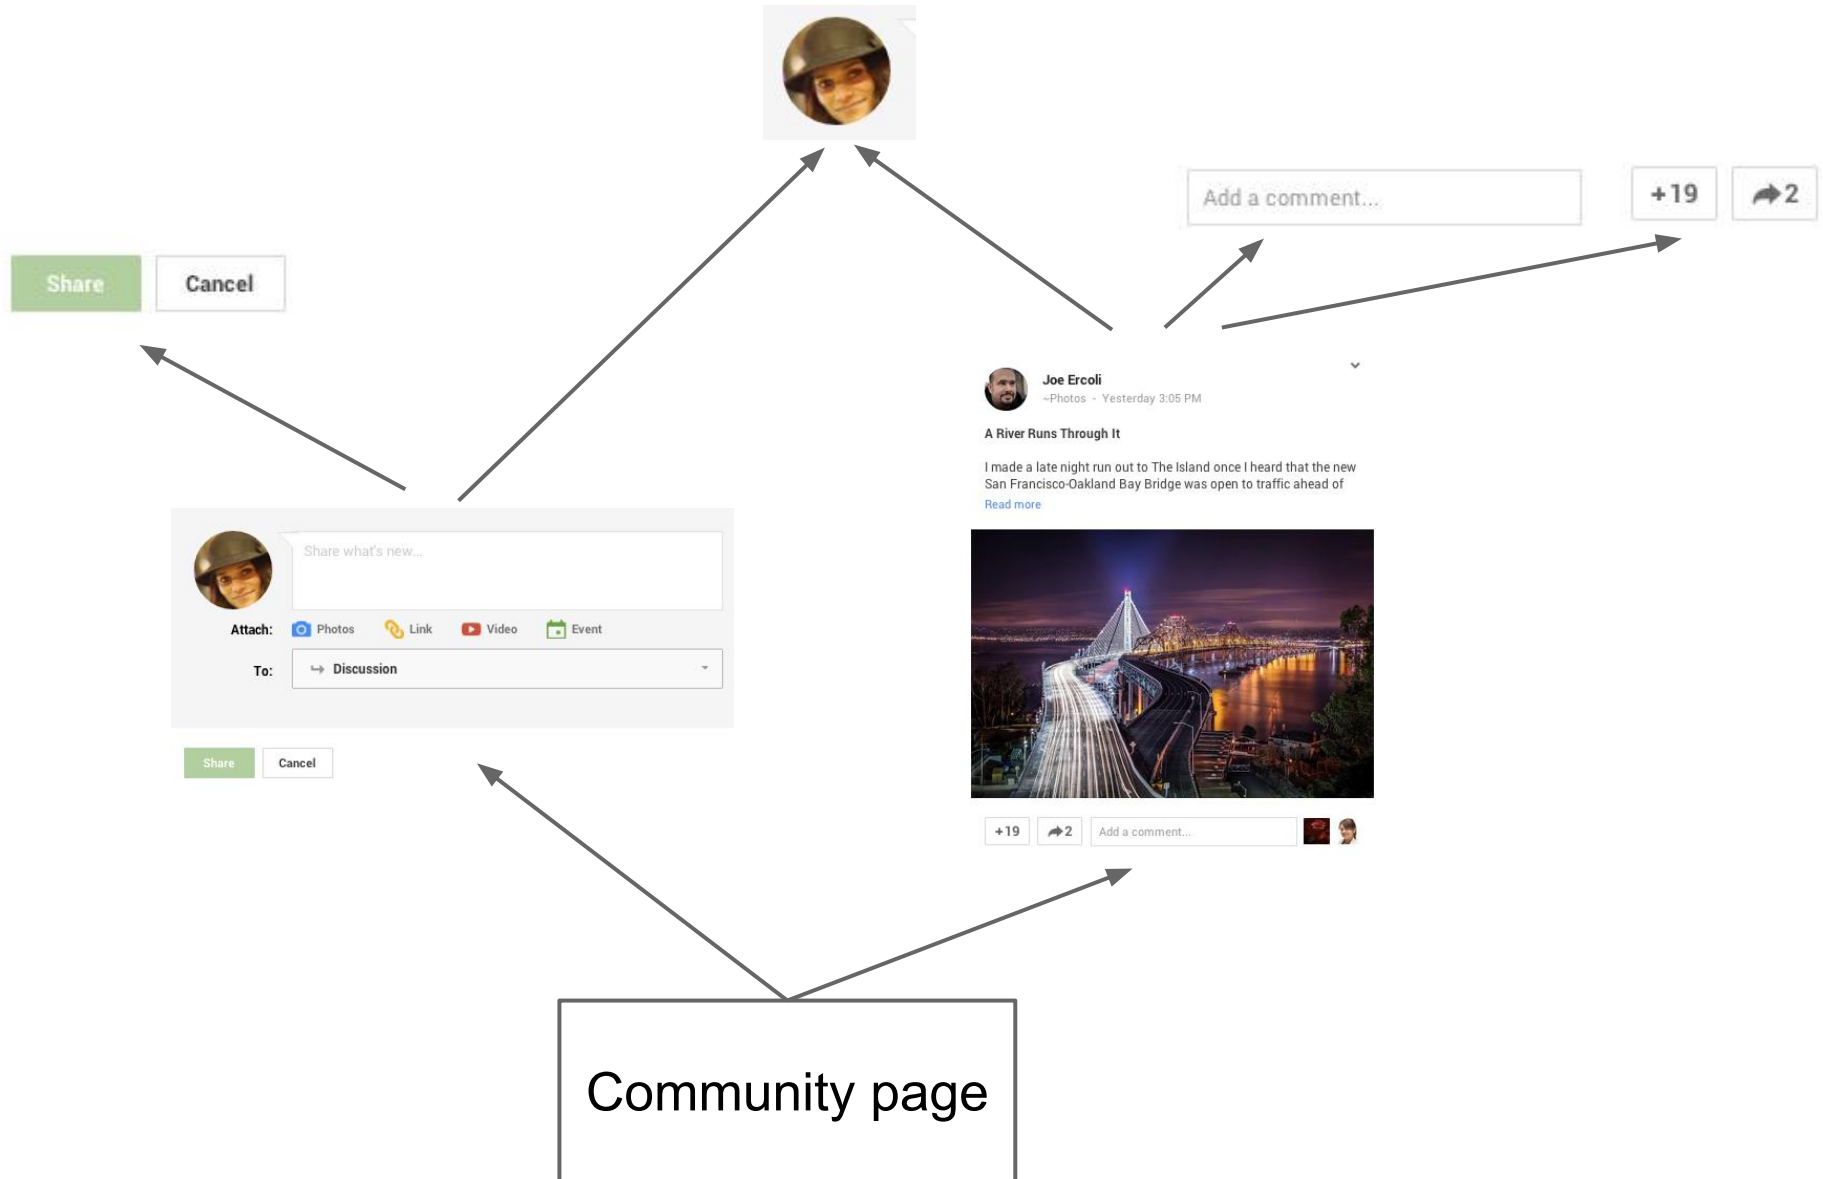

- “requirecss” to express dep from JS to CSS

```
/* *  
 * @requirecss {common.menubutton}  
 */
```

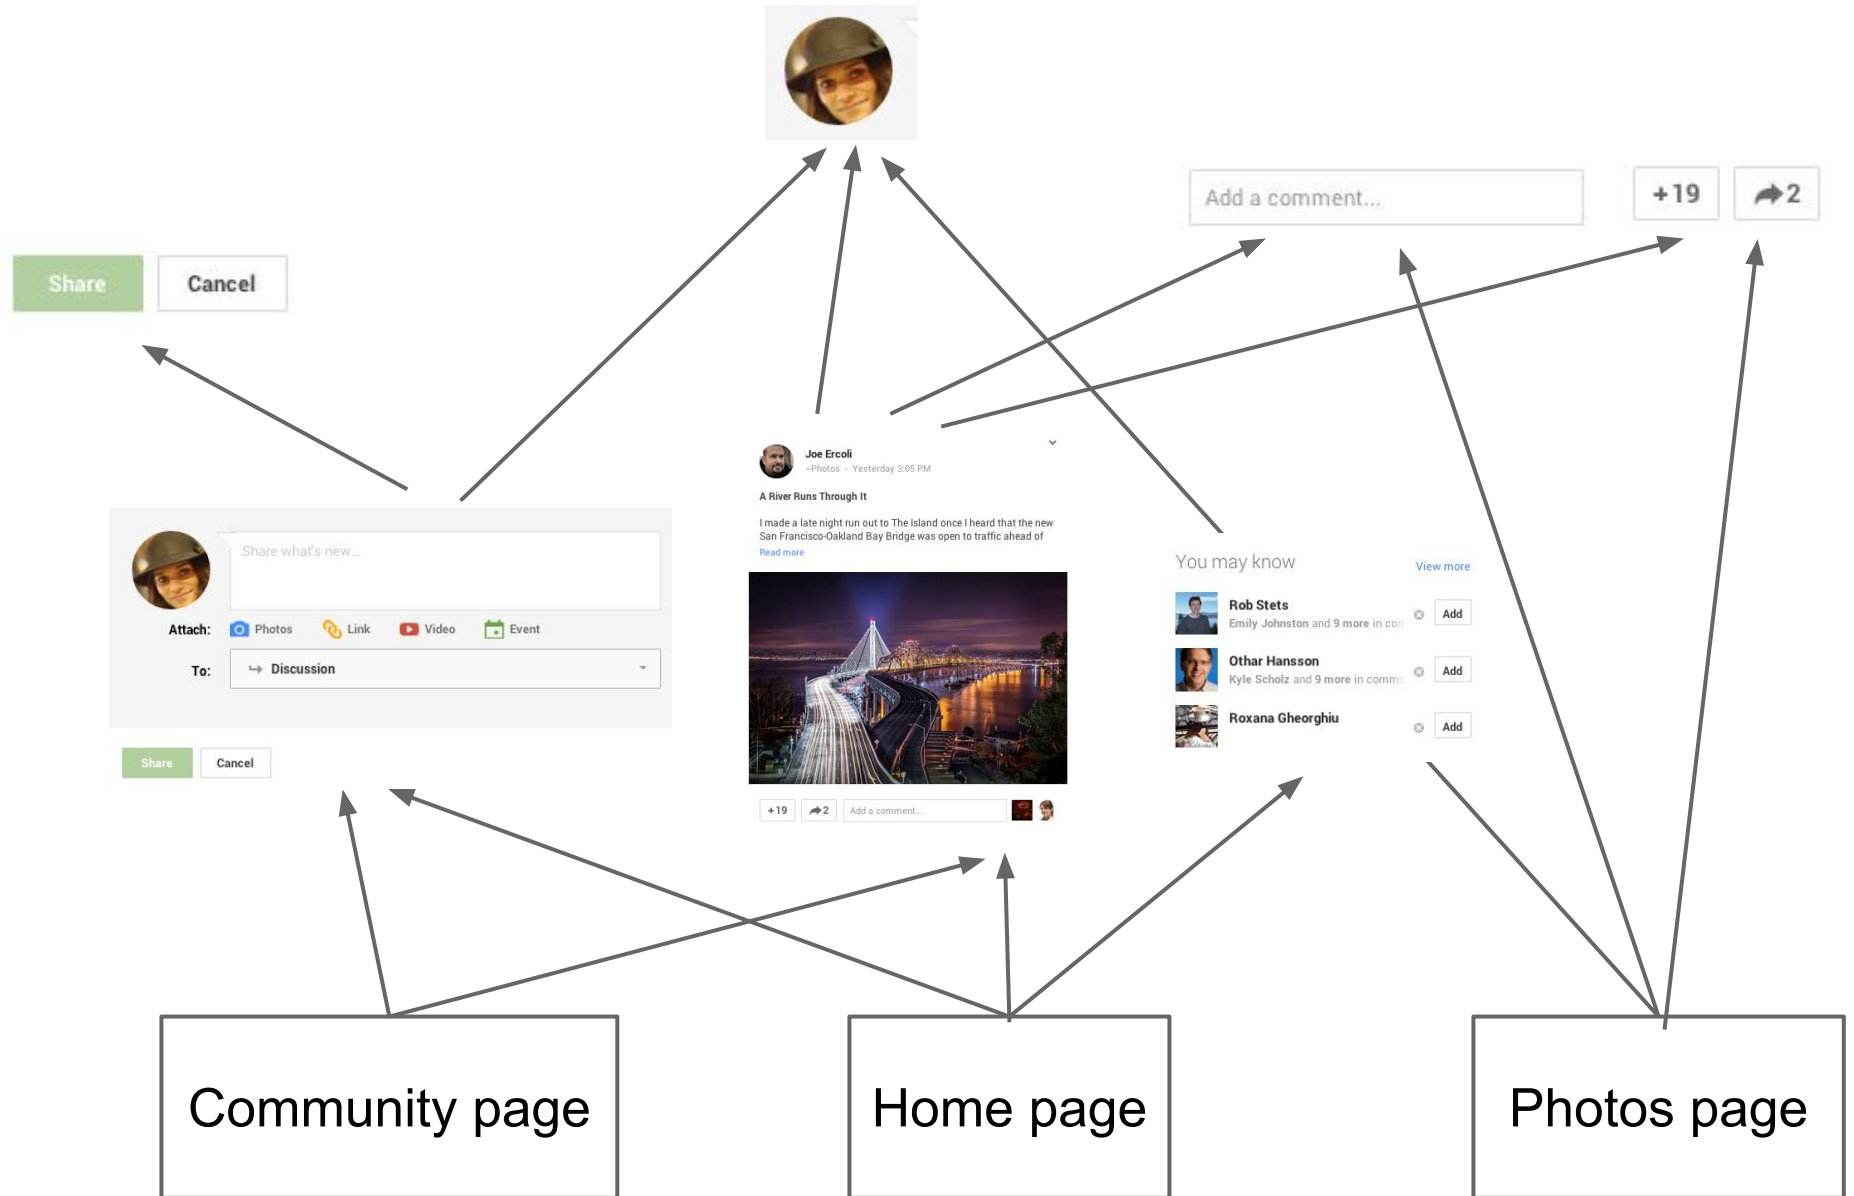

- Works with AMD syntax

# Component dependency graph

# Site wide component dep graph

## II. Constants & Mixins

- Fonts, colors ...
- Syntax
  - @import in SASS
  - @provide / @require in

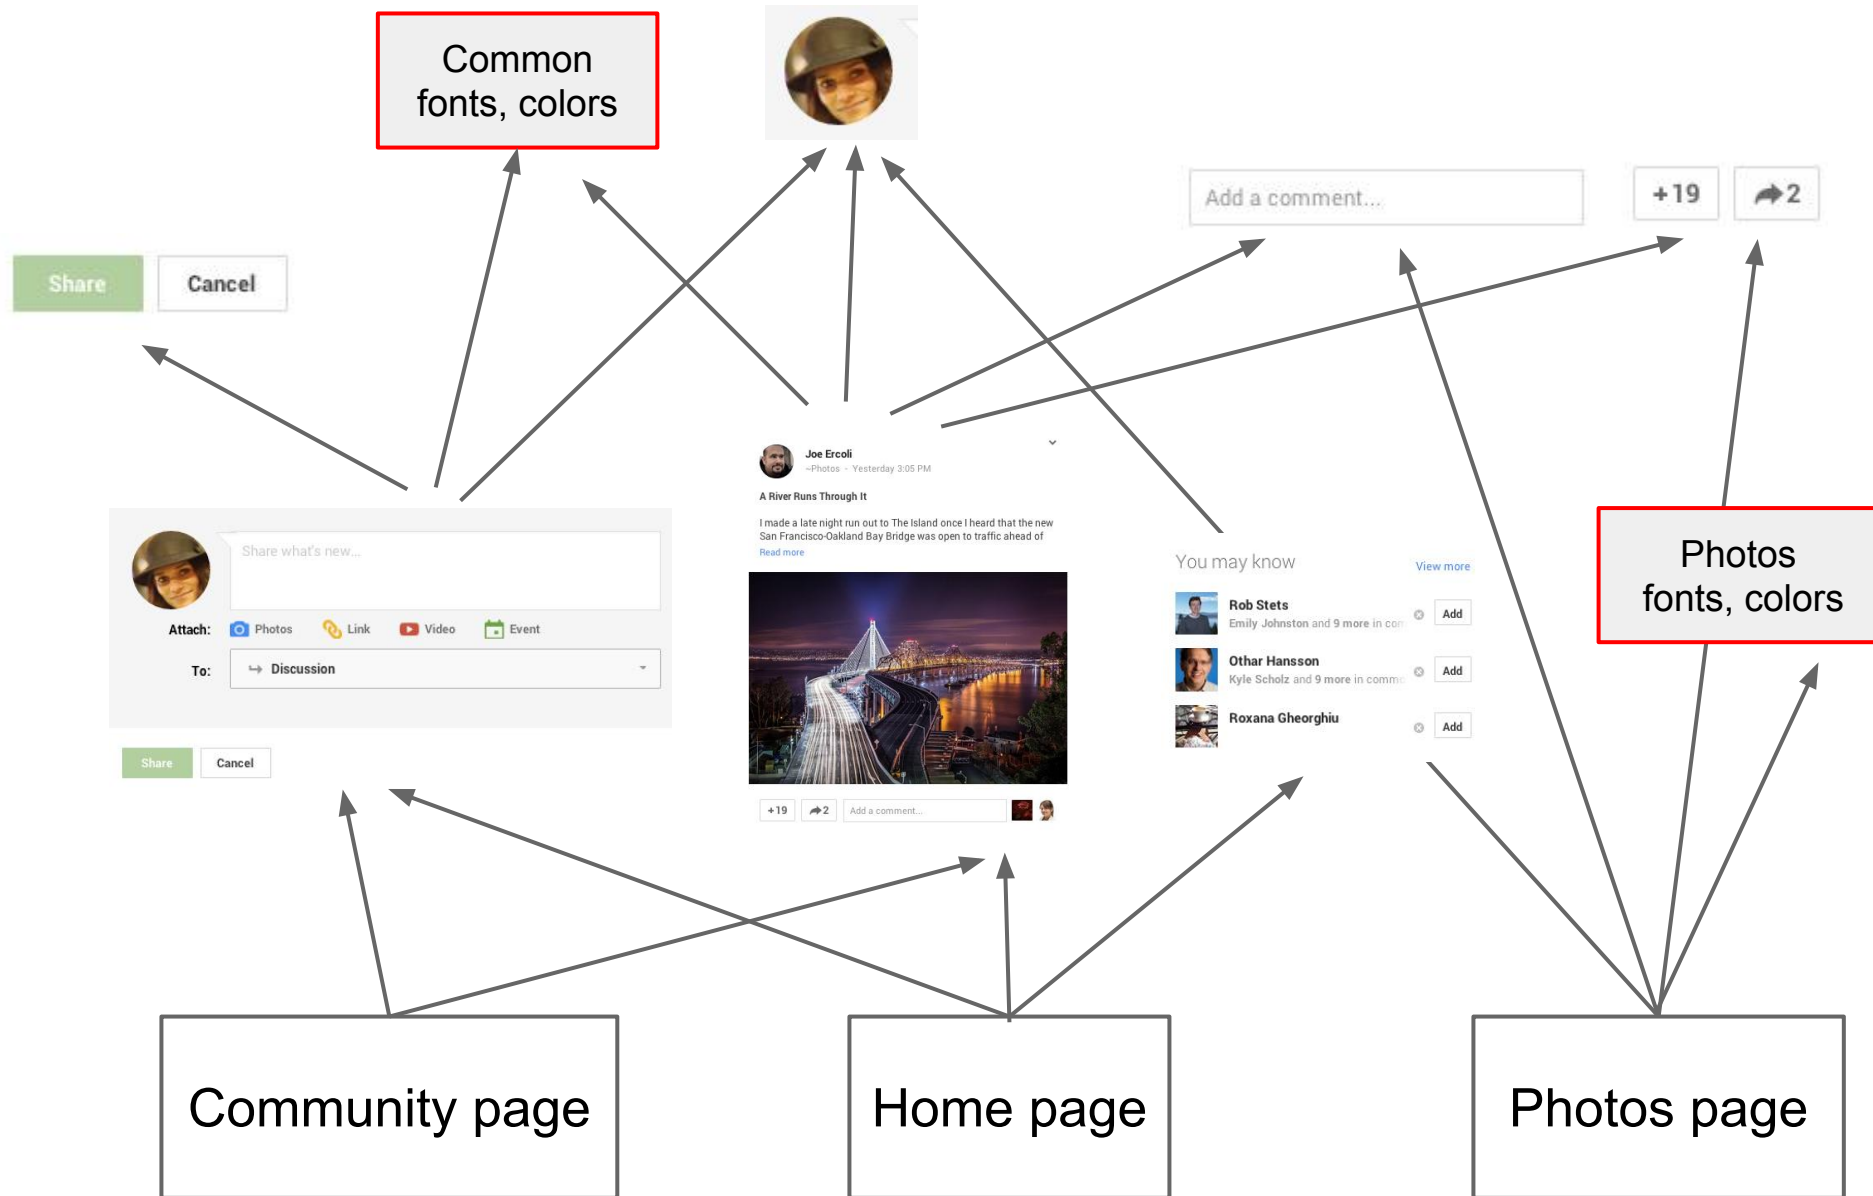

# @provide / @require

```
@provide 'profile.base';  
@require 'common.base';  
  
@def PROFILE_UPDATE_BG_COLOR    #f9edbe;  
@def PROFILE_IMAGE_SIZE        48px;  
...
```

```
@provide 'profile.post';  
@require profile.base';  
  
.postItem {  
  background-color: PROFILE_UPDATE_BG_COLOR;  
}
```

# Constants added to CSS dep graph

That still leaves common CSS libraries ...  
but we'll come back to that.

# **Challenge #2**

Safely compose CSS in browser

# CSS 101

- 'C' for Cascade - order dependent
  - Base styles precede overrides
- Specificity can trump cascade order

# Cascade order dictates styles - not HTML

## HTML:

```
<div class="blue red">  
  Hello World  
</div>
```

## CSS:

```
.red {  
  color: red;  
}  
  
.blue {  
  color: blue;  
}
```

Hello World

# Also CSS Specificity dictates styles

## HTML:

```
<div class="blue red hello">  
  Hello World  
</div>
```

## CSS:

```
.hello.red {  
  color: red;  
}  
  
.blue {  
  color: blue;  
}
```

Hello World

Use the cascade to dictate styles.  
Not specificity.

# Known Wisdom - OOCSS

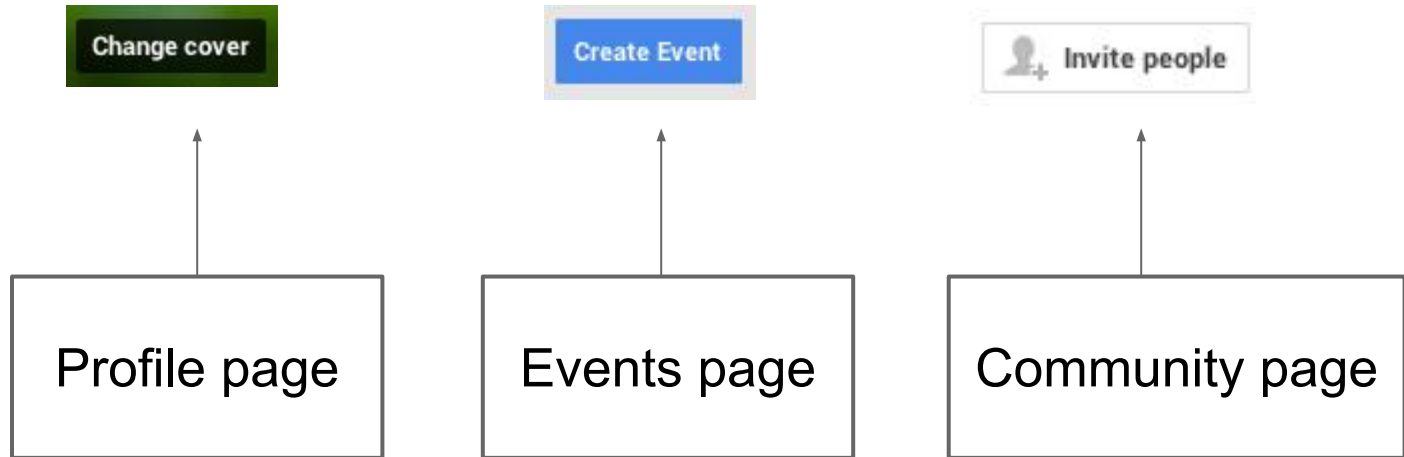

- Minimize selectors. Reuse.
- Simplify specificity
  - Keep specificity as low as possible
- Give rules the same strength
  - Use *cascade order* to override previous styles

# Requirements

Want a framework that enables

- Simple selectors
- Rules of equal strength
- Cascade automatically ordered correctly
- Never worry about specificity

# Overrides for a button

# Strategies For Overriding Styles

- Compound selectors
- Descendant selectors
- Mixin semantics
- SASS @extend semantics
- Simple additional classes

Each has its pros & cons.

with this ...

## Compound selectors

```
.standardButton {  
  display: block; padding: 10px; background-color: white;  
}
```

```
.ProfileButton.standardButton {  
  background-color: black;  
}
```

```
.EventButton.standardButton {  
  background-color: blue;  
}
```

Separate files

Prone to specificity clashes.

# Some may write ...

## Descendant selectors

```
.standardButton {  
    display: block; padding: 10px; background-color: white;  
}
```

```
.ProfilePost .standardButton {  
    background-color: black;  
}
```

```
.EventPost .standardButton {  
    background-color: blue;  
}
```

Tied to HTML structure.

# Tools would give you this ...

## Mixin semantics

```
.ProfileButton {  
  display: block; padding: 10px; background-color: white;  
  background-color: black;  
}
```

Duplication

```
.EventButton {  
  display: block; padding: 10px; background-color: white;  
  background-color: blue;  
}
```

# Or this ...

## SASS @extend & placeholder selector

```
%standardButton {  
  display: block; padding: 10px; background-color: white;  
}
```

```
.ProfileButton {  
  @extend %standardButton;  
  background-color: black;  
}
```

```
.EventButton {  
  @extend %standardButton;  
  background-color: blue;  
}
```

...

...

## @extend compiles to ...

```
.ProfileButton, .EventButton, .CommunityButton {  
  display: block; padding: 10px; background-color: white;  
}
```

```
.ProfileButton {  
  background-color: black;  
}
```

```
.EventButton {  
  background-color: blue;  
}
```

```
.CommunityButton {  
  background-color: grey;  
}
```

Feature specific selectors in  
shared module in dep graph

What if you could just write this ...

## Additional classes

```
.standardButton {  
  display: block; padding: 10px; background-color: white;  
}
```

```
.ProfileButton {  
  background-color: black;  
}
```

```
.EventButton {  
  background-color: blue;  
}
```

```
.CommunityButton {  
  background-color: grey;  
}
```

And rely on correct cascade order.

# Dictate cascade order with @require

```
@provide 'standardButton';  
  
.standardButton {  
    display: block; padding: 10px; background-color: white;  
}
```

```
@require 'standardButton';  
  
.ProfileButton {  
    background-color: green;  
}
```

```
@require 'standardButton';  
  
.EventButton {  
    background-color: green;  
}
```

# Dictate cascade order with @require

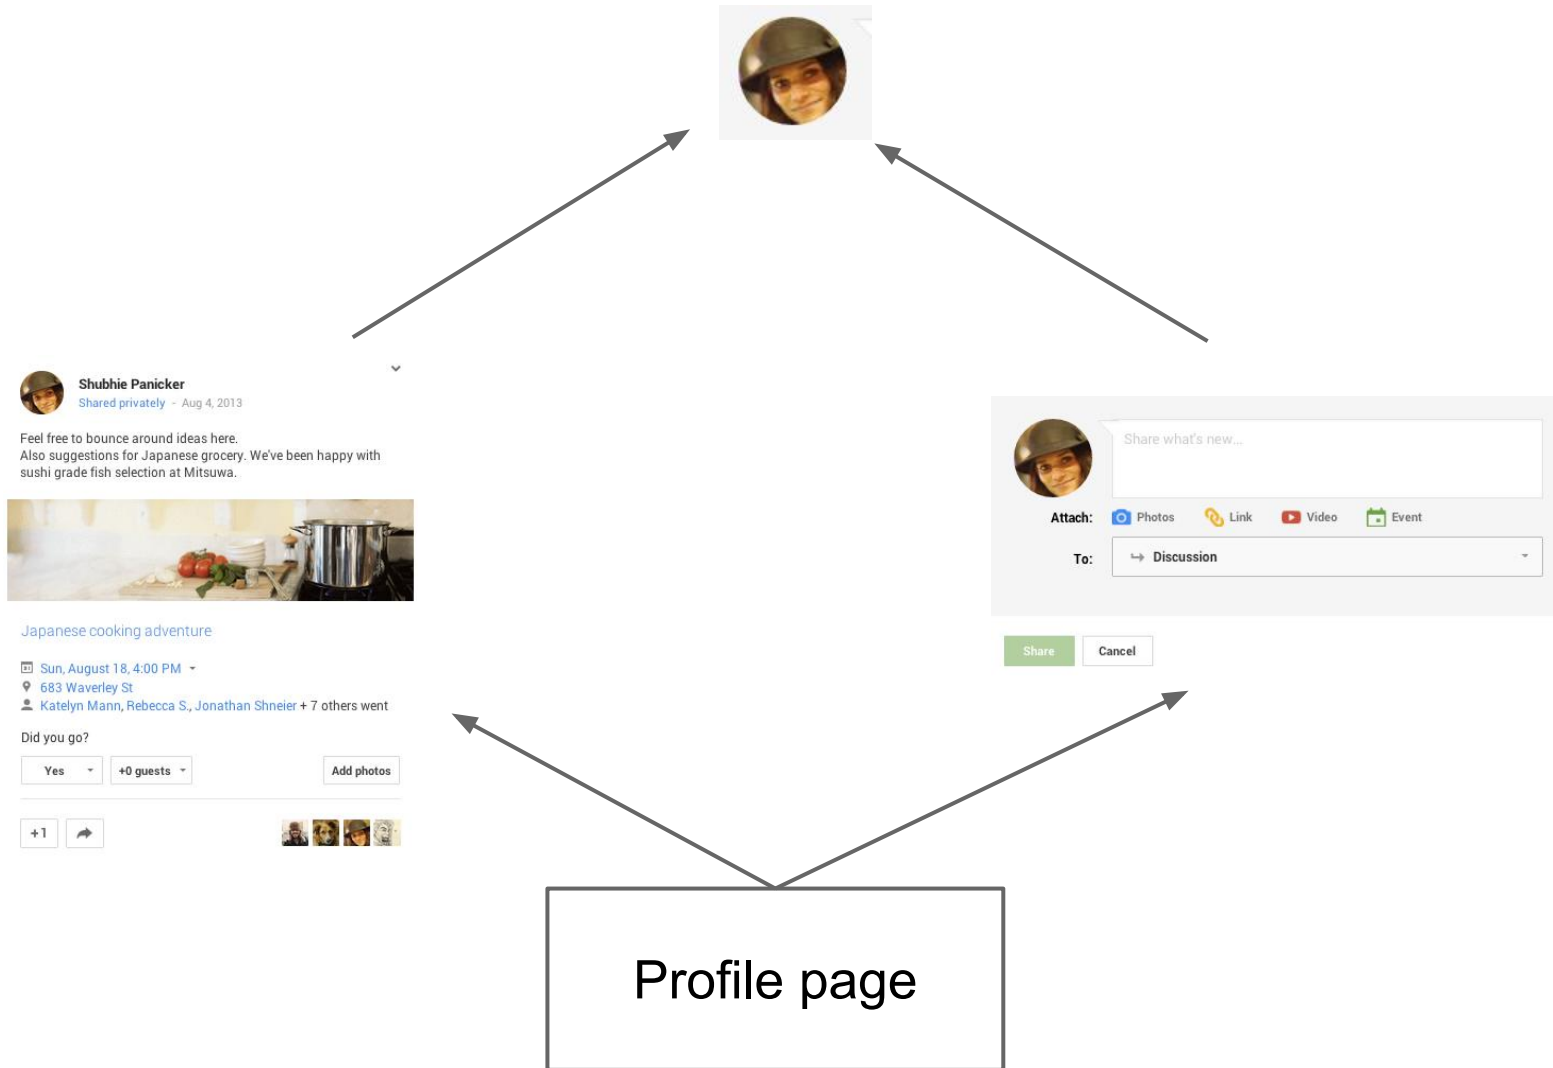

- Expand @require semantics for ordering
- Alternatives considered
  - Move ordering to JS and Templates
  - Alternative syntax
- Meets requirements
  - Minimize selectors
  - Rules of equal strength

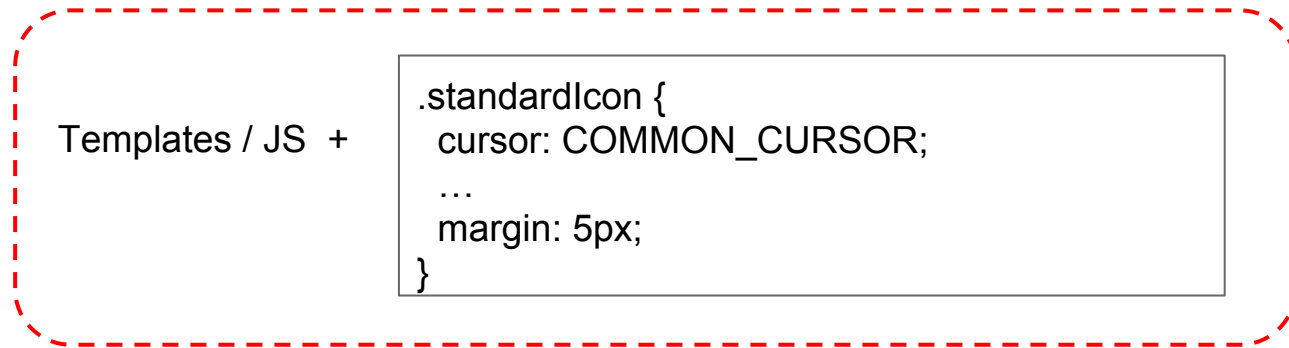

# What about style overrides for components ?

Firstly, depending on shared components already guarantees correct cascade order!

# Many widgets want the icon

# Component Dependency Graph

Templates / JS +

```
.PostIcon {  
  margin: 7px;  
}
```

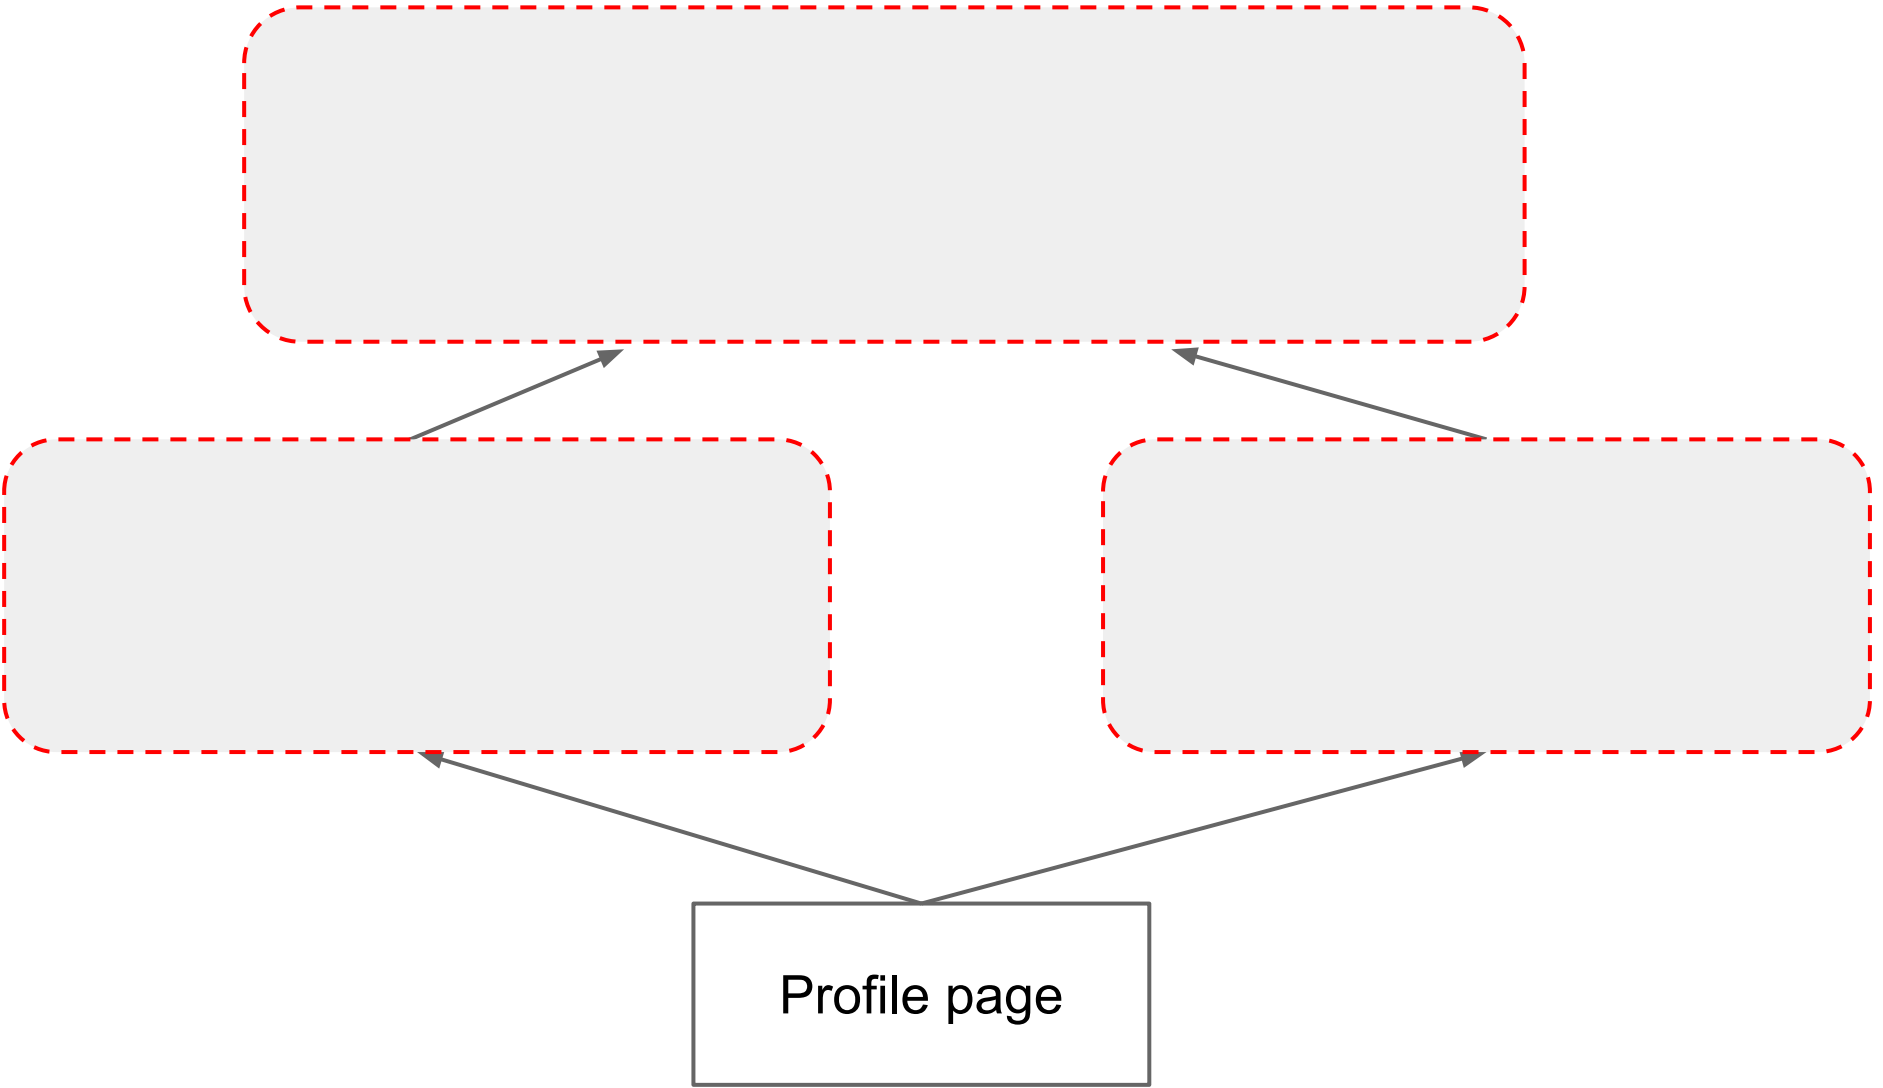

Templates / JS +

```
.shareboxIcon {  
  margin: 10px;  
}
```

Profile page

The diagram shows a 'Profile page' box at the bottom with two arrows pointing upwards to the two middle nodes. The middle nodes are enclosed in red dashed rounded rectangles and contain CSS code for '.PostIcon' and '.shareboxIcon' respectively. The top node is also enclosed in a red dashed rounded rectangle and contains CSS code for '.standardIcon'.

# Component Dependency Graph

Flatten to cascade. Preserves order.

# Framework creates correct cascade order from graph

```
.standardIcon {  
  cursor: COMMON_CURSOR;  
  ...  
  margin: 5px;  
}  
...  
...
```

```
.postIcon {  
  margin: 7px;  
}  
...  
...
```

```
.shareboxIcon {  
  margin: 10px;  
}  
...  
...
```

# How to override styles of a shared component ?

- Firstly, correct order with dep graph
- Add additional classes
  - Plumb class into component's template
  - Preferred if component almost always needs overrides
- Descendant selectors
  - Tied to *context* not HTML structure

# ... Covered so far

## Types of CSS dependencies

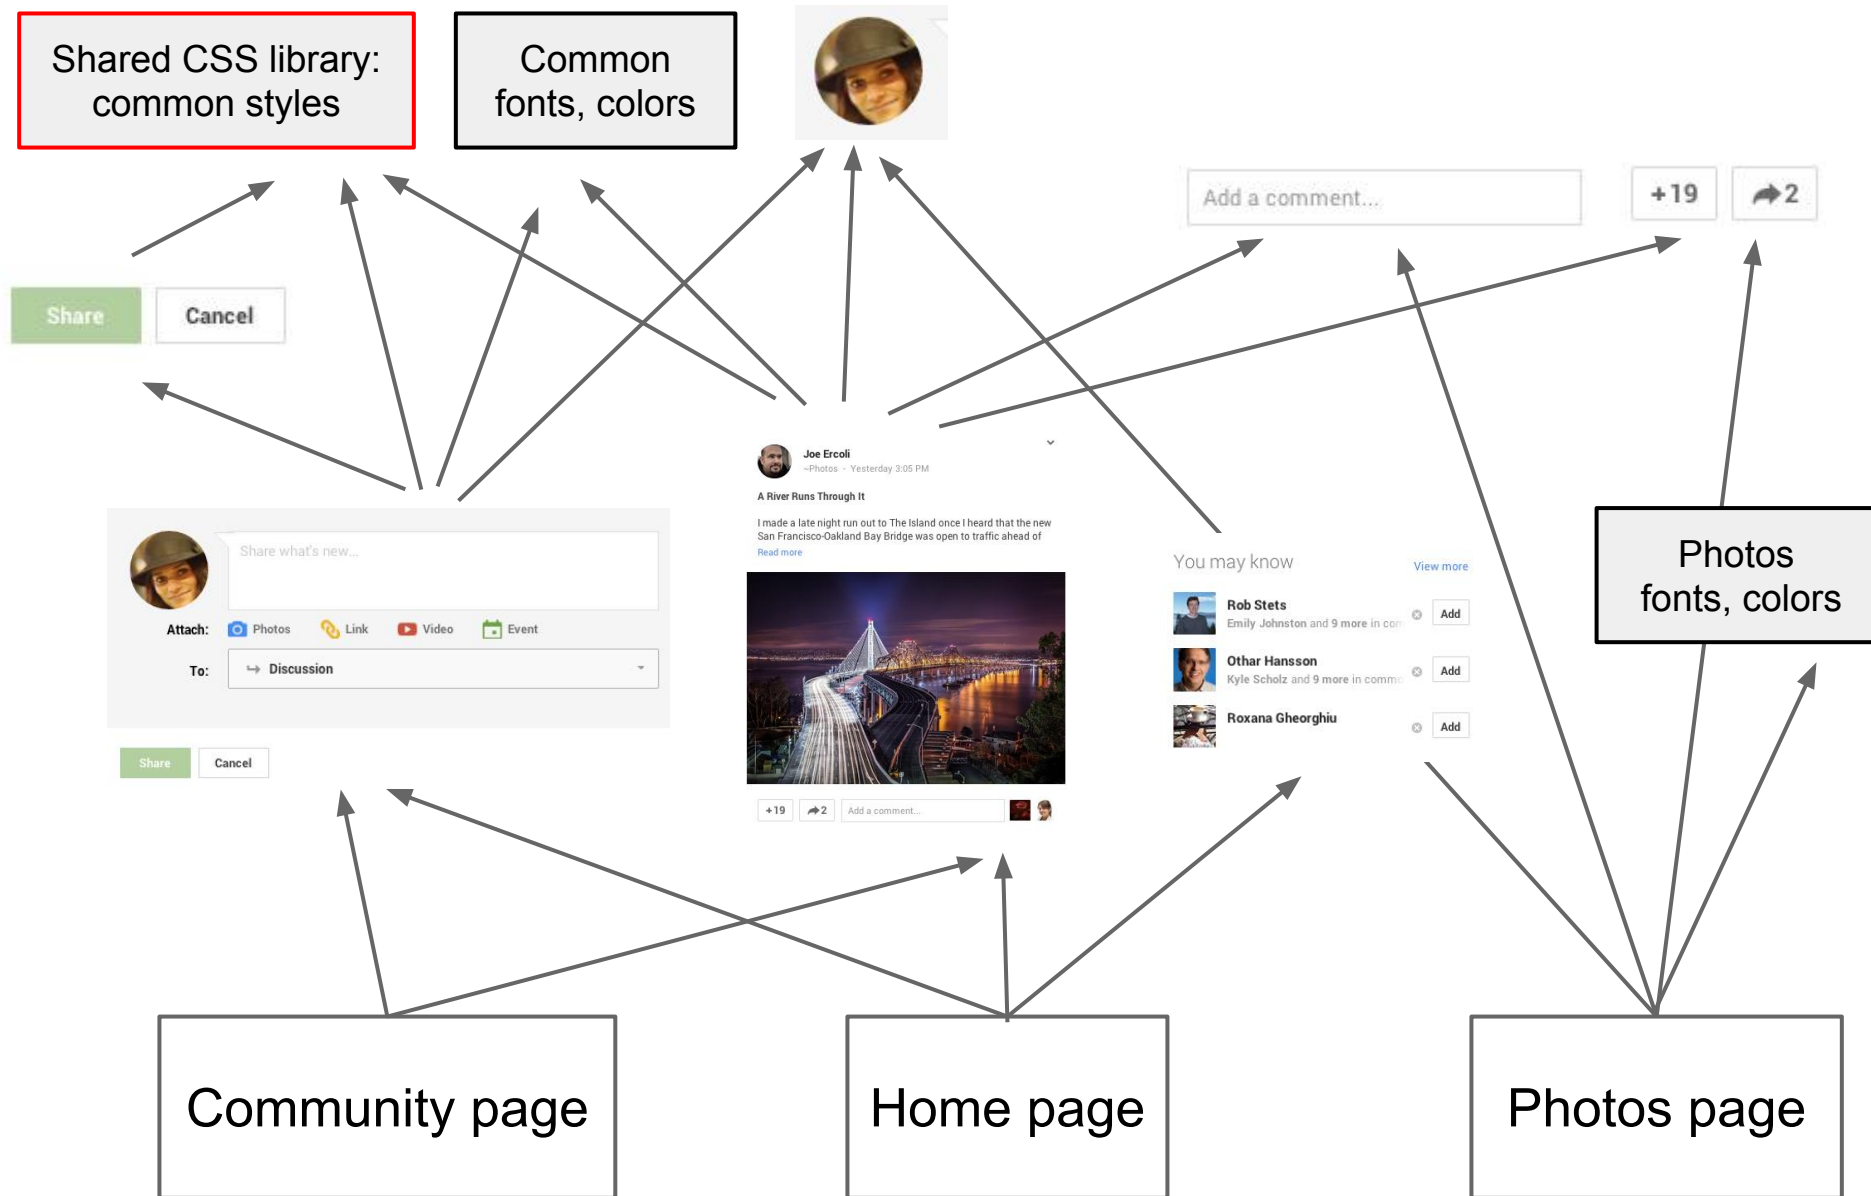

- CSS from shared components
- Constants & Mixins
- CSS libraries

## And

- Dependency syntax in each category
- Style overrides & cascade order

# Complete CSS dep graph

# Dependency Syntax is Enforced

Tools | Tests | Compiler passes

- requirecss
- @require
  - same selector overrides
  - ordering of classes in HTML

# Module System

## #1 Dependency System

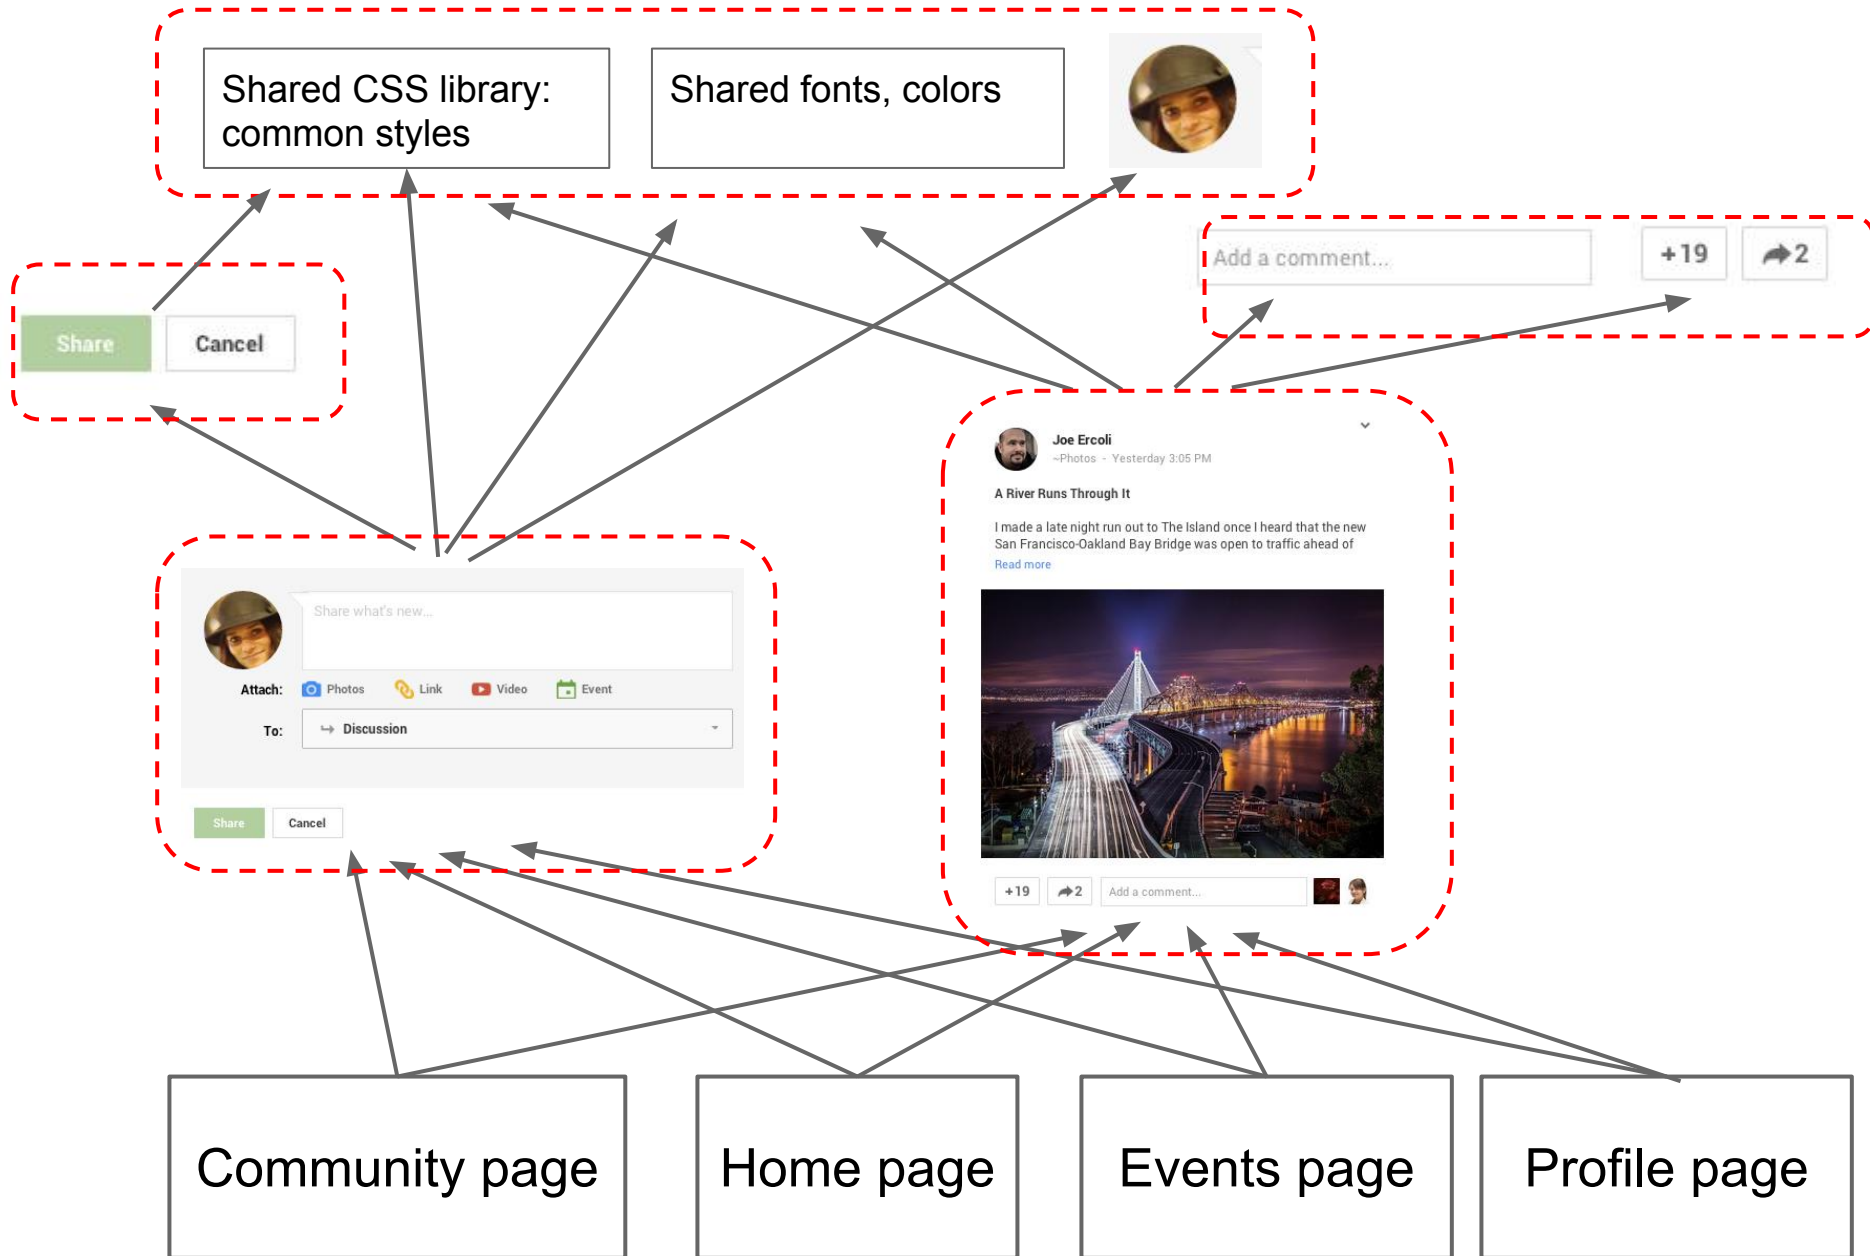

- Namespaces
- Express dependency -- requirecss & @require

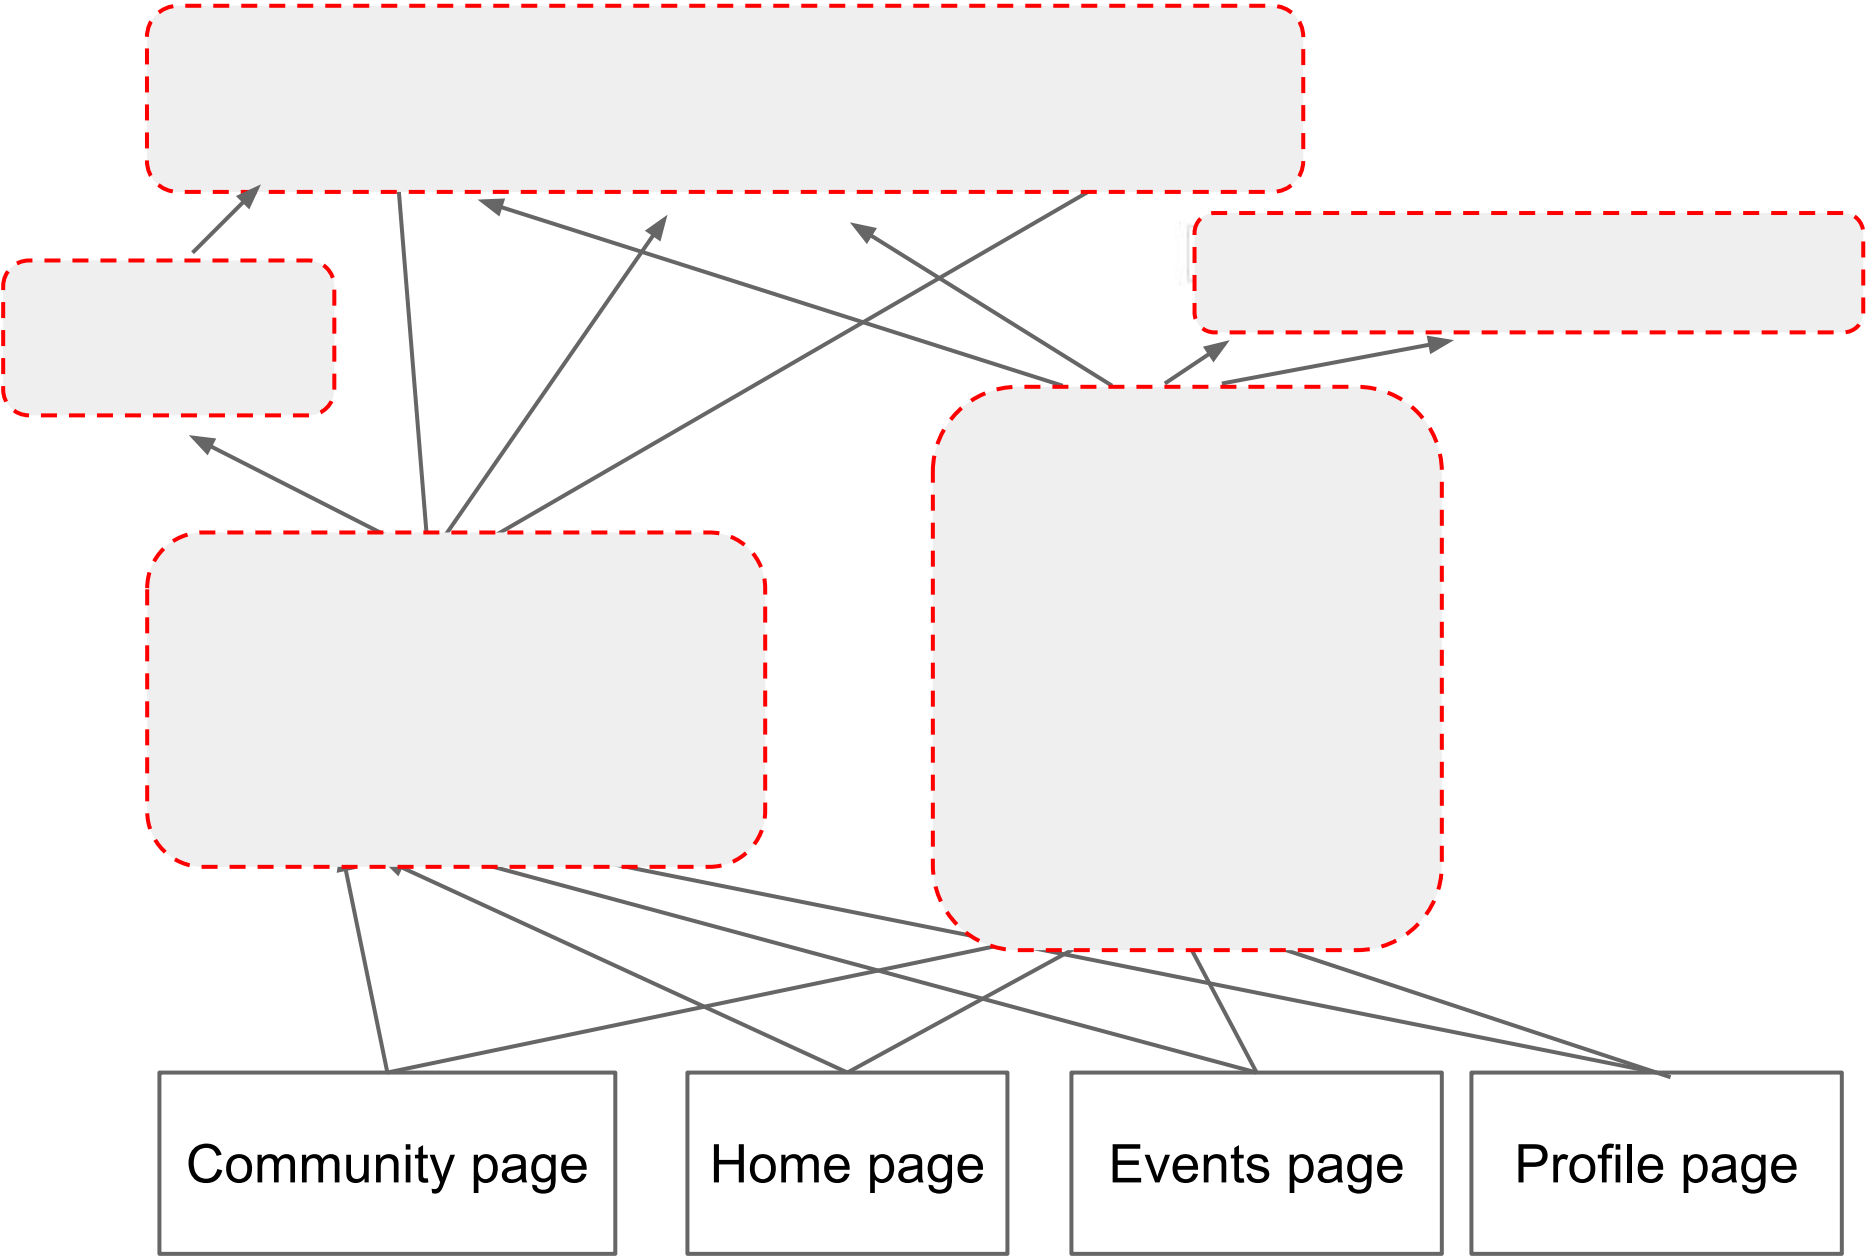

## #2 Assembly & Serving system

# Assembly & Serving System

# Assembly: Compile to Modules

# Compile to Modules

Flatten to cascade. Preserve order.

# Compilation

- Module
  - CSS grouping that is downloaded together
  - Shared deps downloaded with the first module that needs it
  - Analogous JS module
- Module-set
  - All the modules

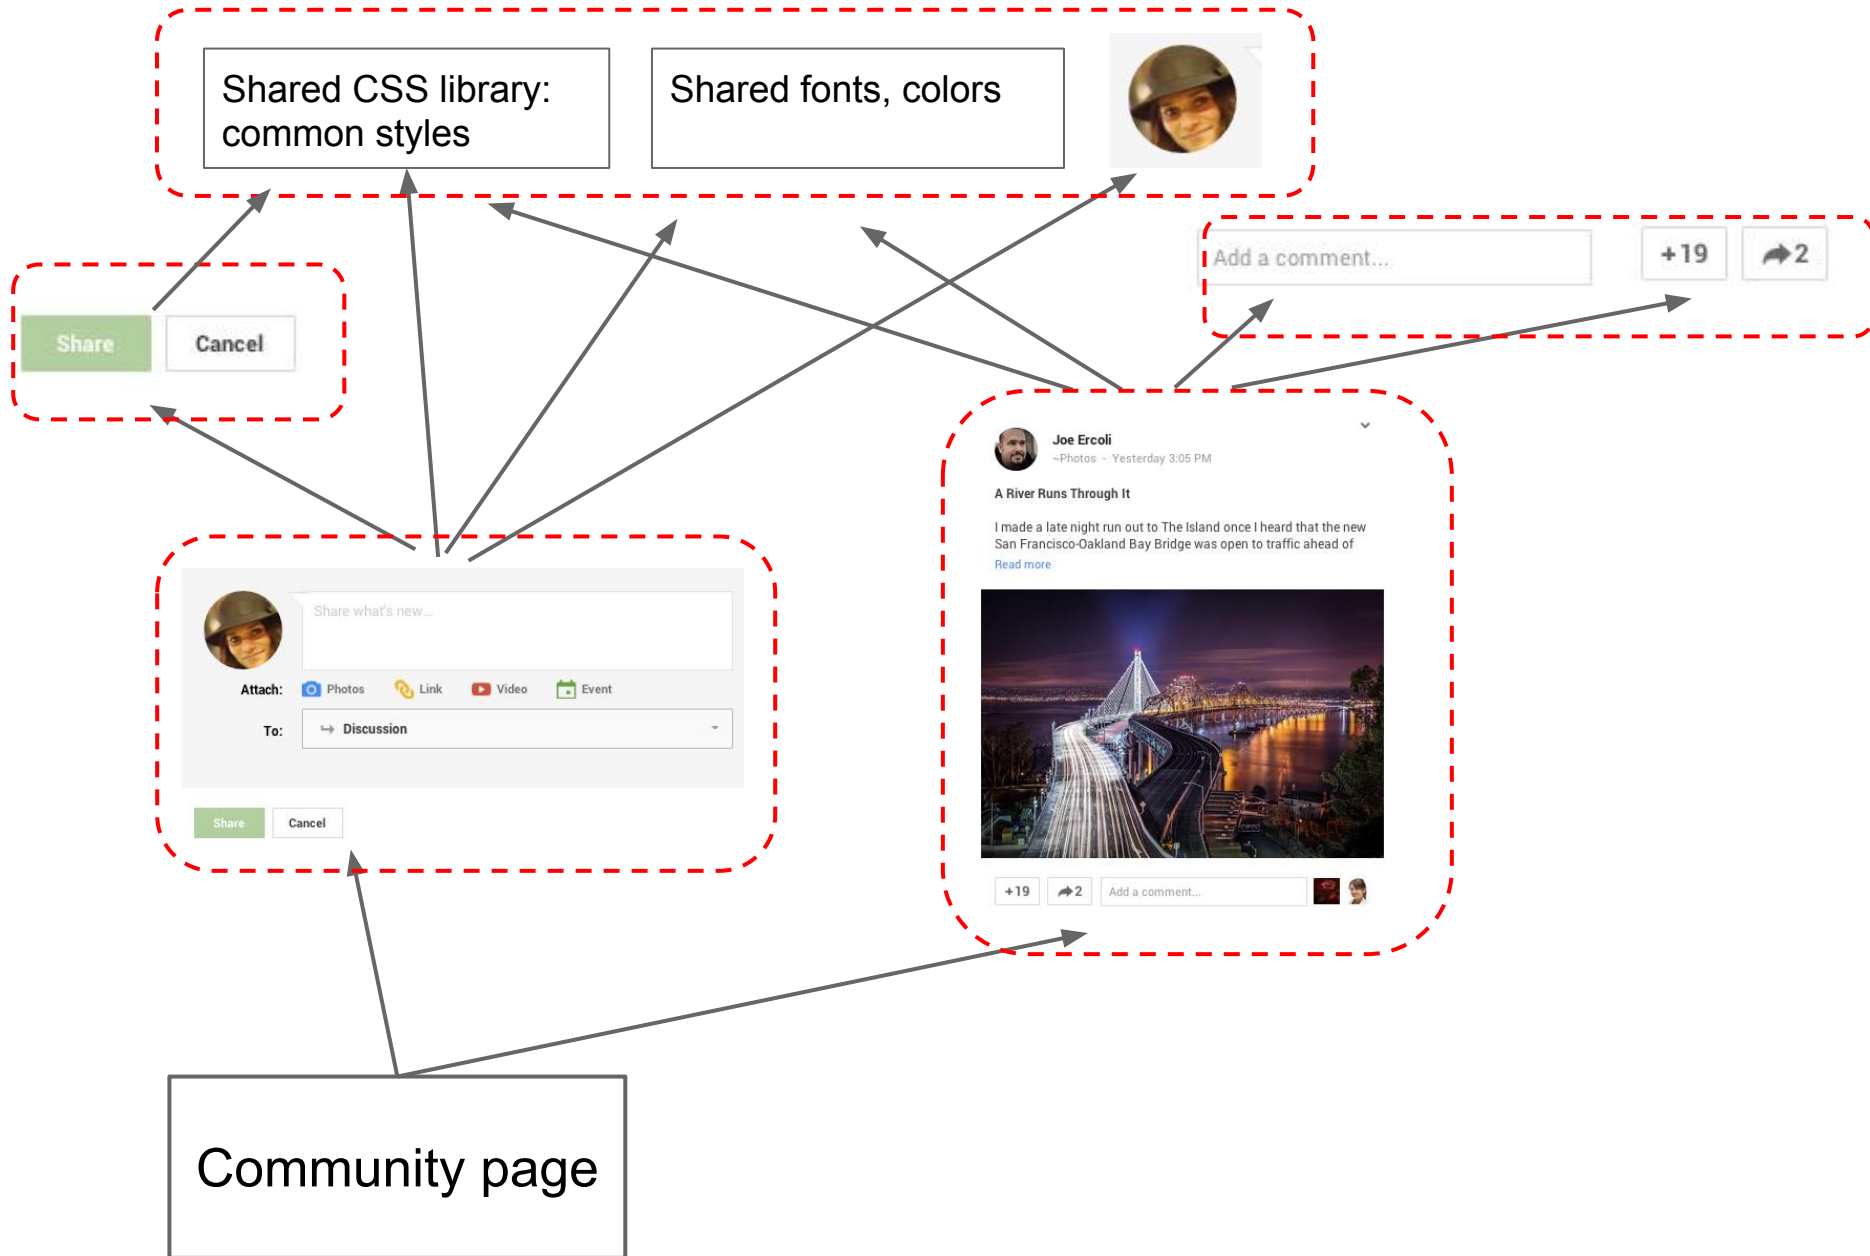

# Serving System

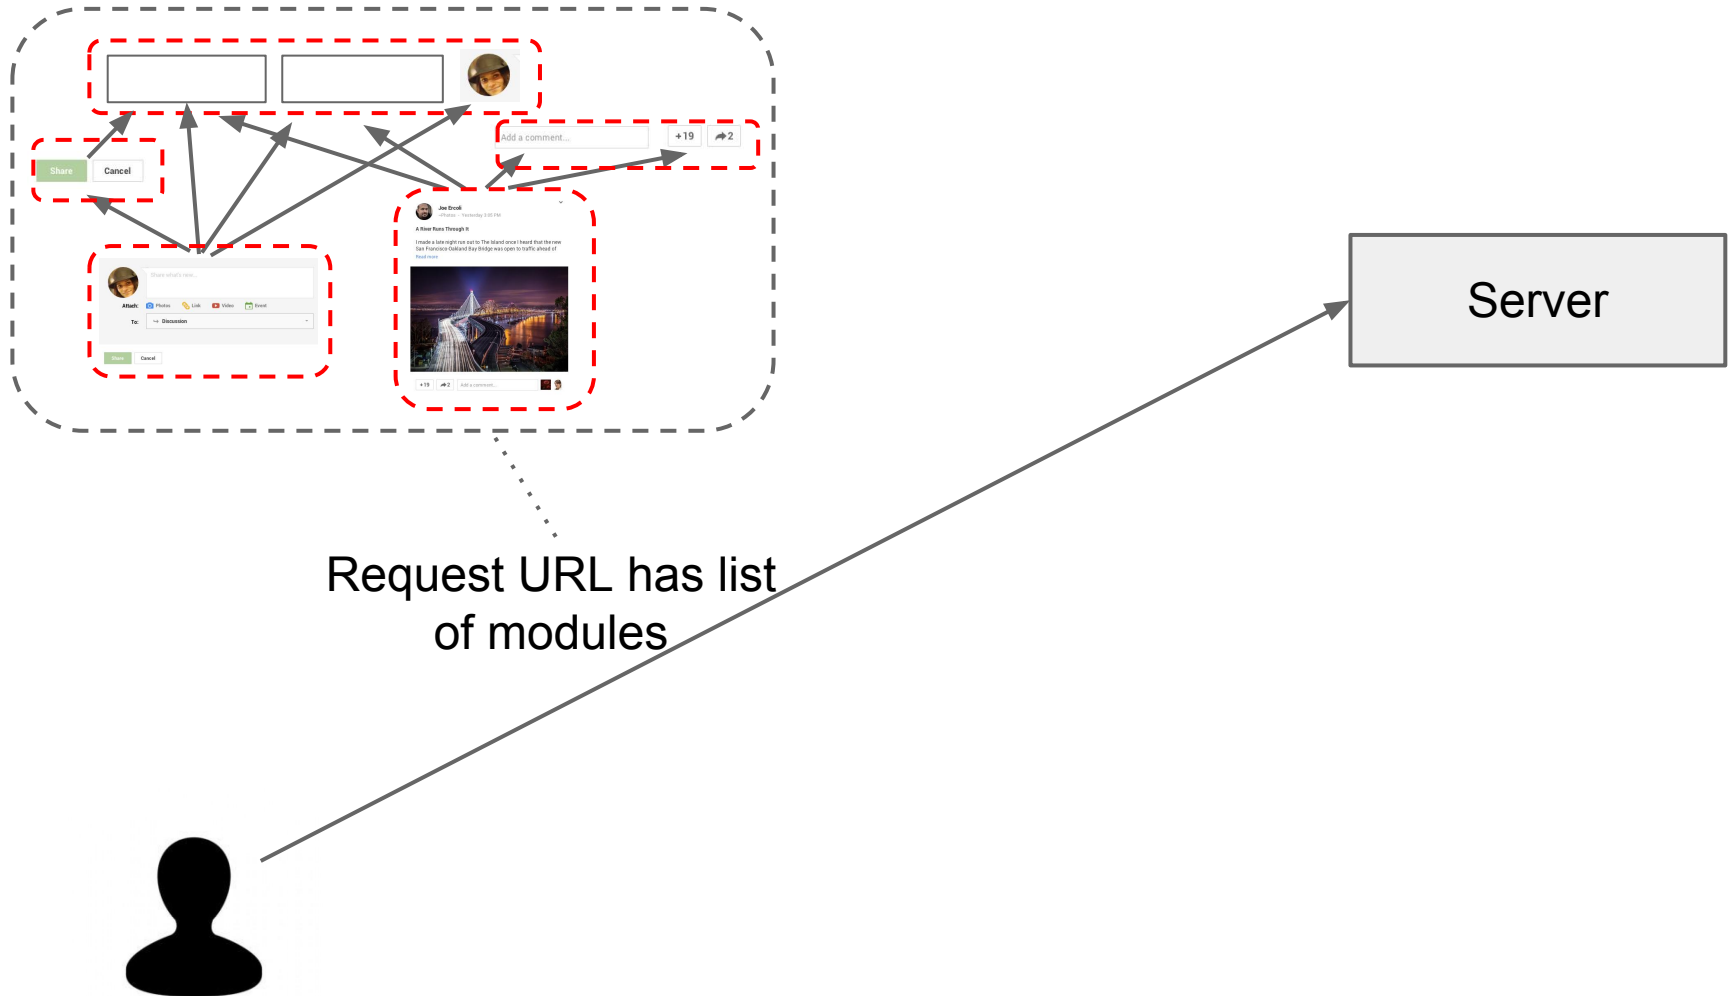

## Requirements

- Minimize number of requests
- Cacheable responses

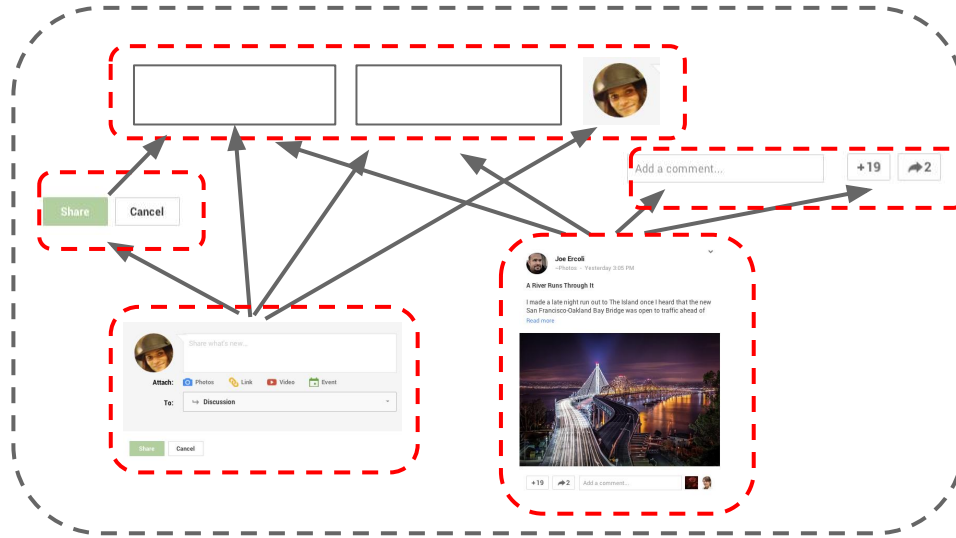

# Client knows module deps

# Single Request

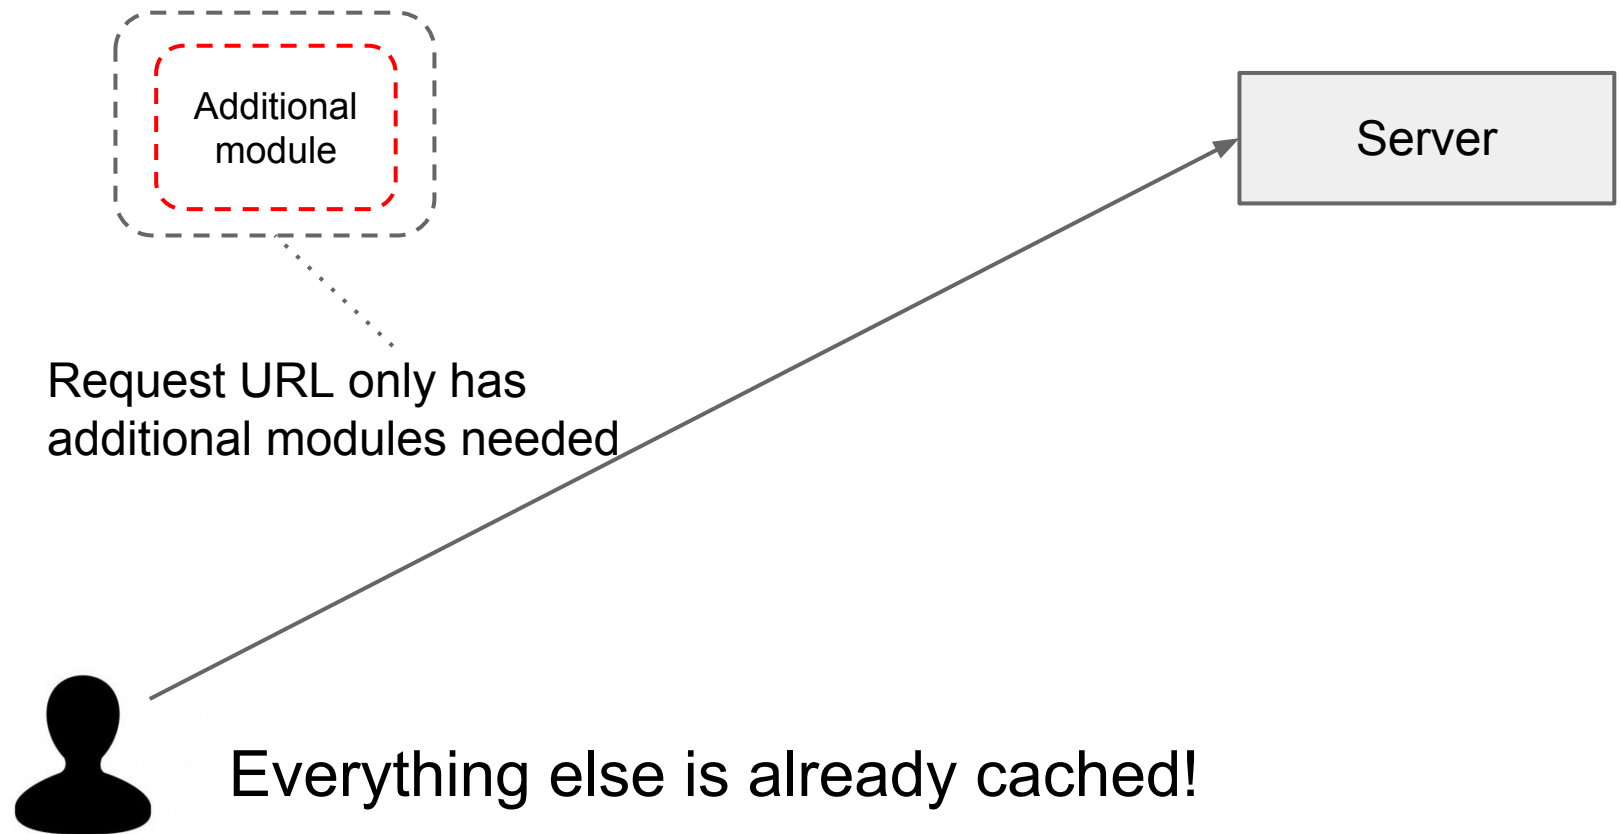

# Concatenated response

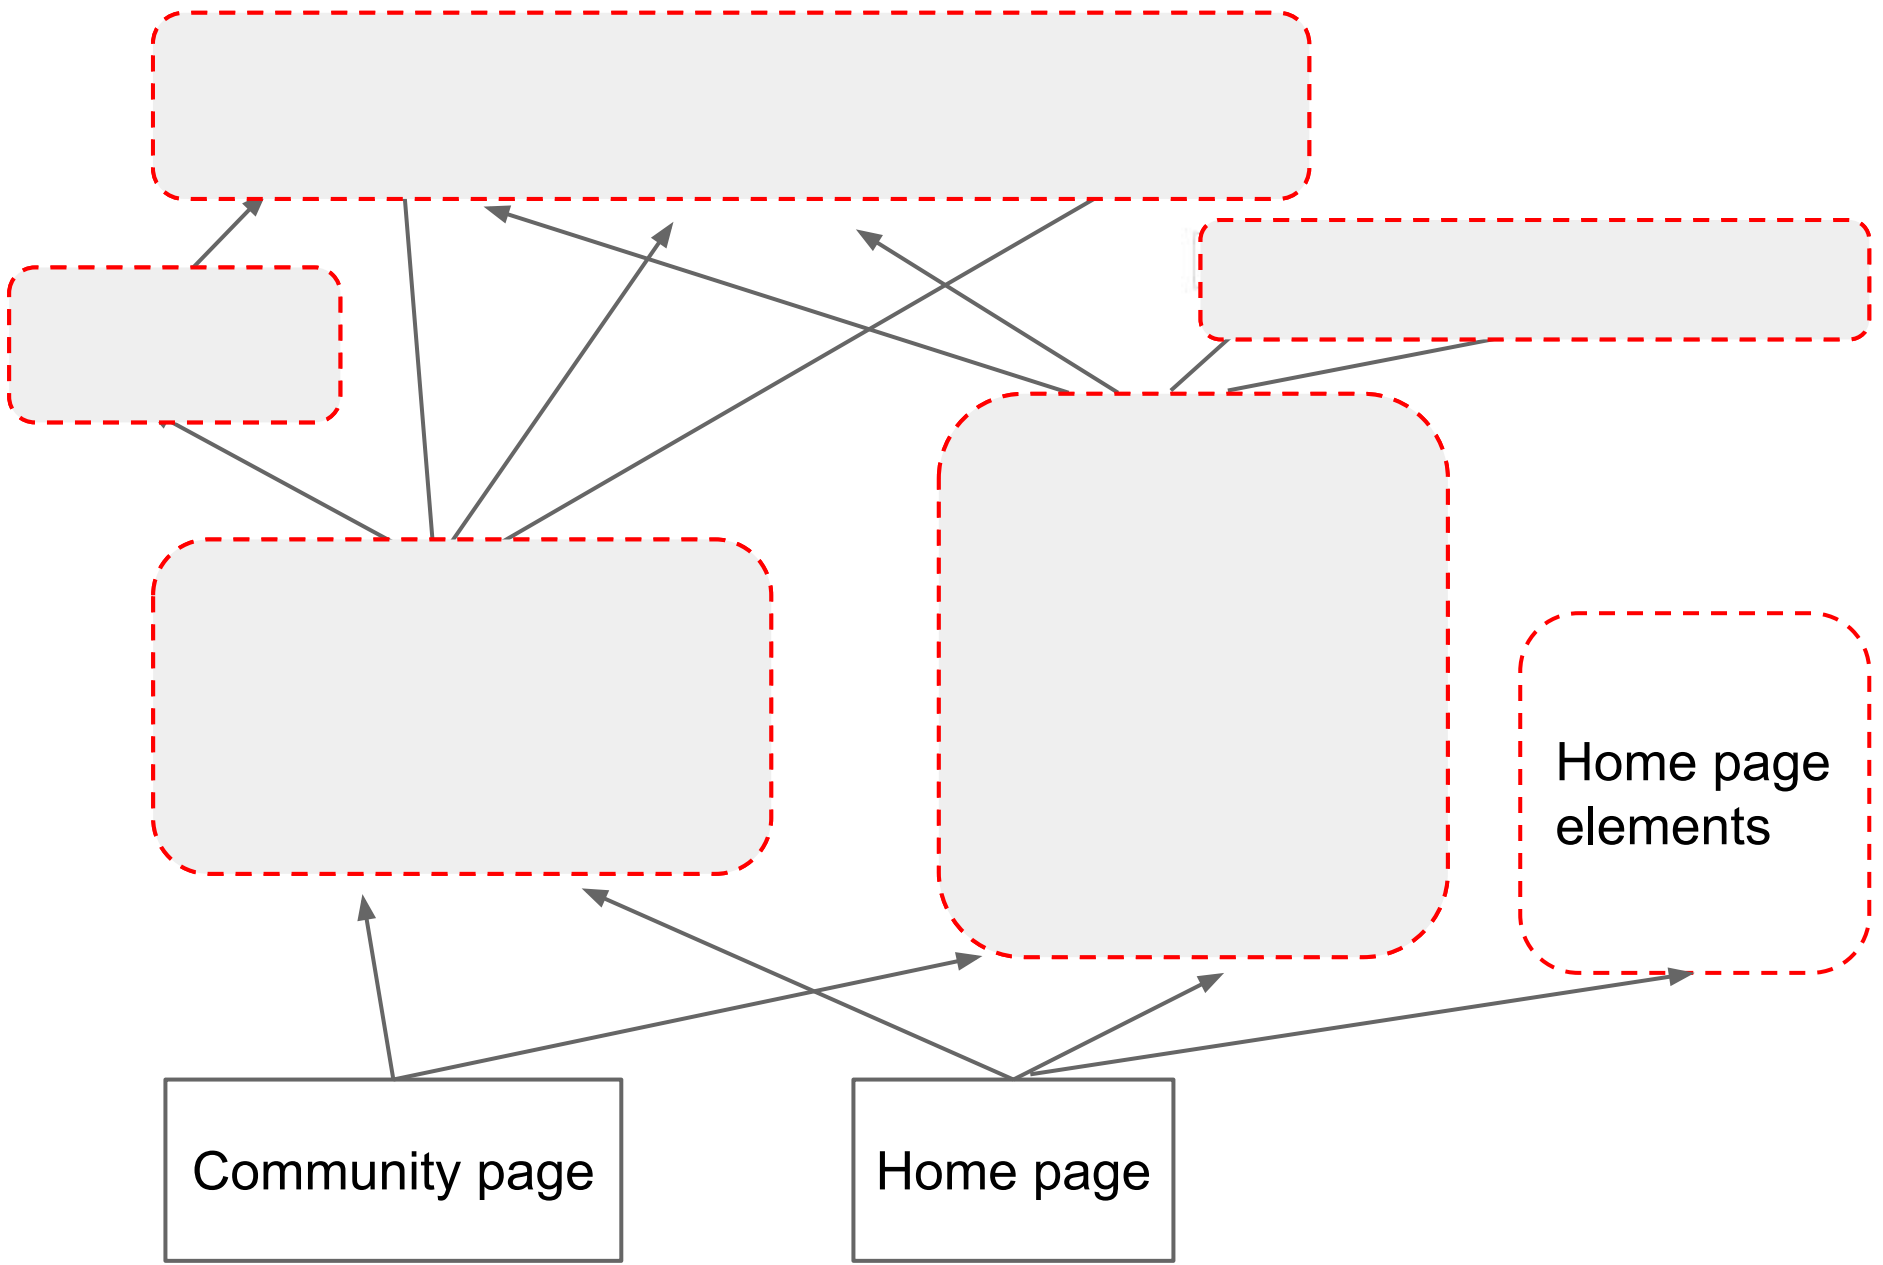

Server returns stylesheet

# Next Request -- for next page

# Dependency Graph Ensures Safety

# Google+ Problems Addressed

- Initial bundle is too big and too slow
- Manually curated CSS is prone to reordering
  - Broken UI
  - Specificity wars

# Open source Resources

- Closure Stylesheets
- Closure Templates

# Thank You!

+Shubhie Panicker
